of the current web services technologies and SOA for construction supply chain collaboration and management through a prototype service oriented system framework namely SC Collaborator Supply Chain Collaborator SC Collaborator is designed and implemented according to the system requirements for construction supply chain integration The framework leverages web services and portal technologies open standards and open source packages Although some web services systems allow user connection and integration through web services protocol their system functions and operations are fixed and not adaptive to changes The SC Collaborator framework enables flexible reconfiguration of internal service invocation integration and system layout without recompilation of the system To align a collaborative system with the supply chains it integrates this thesis proposes and demonstrates the incorporation of supply chain models in a service oriented system framework Specifically the Supply Chain Operations Reference SCOR framework a widely used model developed by the Supply Chain Council is employed to model construction supply chains The SCOR modeling framework provides a generic and hierarchically structured means to specify supply chain networks and processes The SCOR process elements and operations are wrapped as individual web service units which are integrated and orchestrated in the service oriented SC Collaborator framework A case example on a student center construction project is used to illustrate the SCOR modeling framework for performance monitoring The SC Collaborator framework is also extended to support collaboration among distributed service oriented collaborative systems Due to the temporary project based relationship among participants in construction projects project participants that do not have direct business partnership may hesitate to expose and share sensitive and proprietary information with each other The distributed SC Collaborator framework allows users to specify shared information and data This thesis discusses how information consistency is ensured among distributed SC Collaborator systems The distributed network of SC Collaborator systems is tested with a case scenario of a completed expansion project of a three storey residential building
