

3.4 Cycles of Matter

Lesson Objectives

-  Describe how matter cycles among the living and nonliving parts of an ecosystem.
-  Describe how water cycles through the biosphere.
-  Explain why nutrients are important in living systems.
-  Describe how the availability of nutrients affects the productivity of ecosystems.

Lesson Summary

Recycling in the Biosphere Matter, unlike energy, is recycled within and between ecosystems. Elements pass from one organism to another and from one part of the biosphere to another through **biogeochemical cycles**, which are closed loops powered by the flow of energy.

The Water Cycle Water moves between the ocean, the atmosphere, and land.

- ▶ Evaporation is the process in which water changes from a liquid to a gas.
- ▶ Transpiration is the process in which water evaporates from the leaves of plants.

Nutrient Cycles The chemical substances that an organism needs to survive are called **nutrients**. Like water, nutrients pass through organisms and the environment.

- ▶ **Carbon Cycle:** Carbon is a key ingredient of all organic compounds. Processes involved in the carbon cycle include photosynthesis and human activities such as burning.
- ▶ **Nitrogen Cycle:** Nitrogen is needed by all organisms to build proteins. Processes involved in the nitrogen cycle include nitrogen fixation and denitrification.
 - In **nitrogen fixation**, certain bacteria convert nitrogen gas into ammonia.
 - In **denitrification**, other soil bacteria convert nitrogen compounds called nitrates back into nitrogen gas.

Nutrient Limitation A nutrient that, in short supply, can limit the productivity of an ecosystem is called a **limiting nutrient**.

Grece, 2006 String theory is a physical model whose fundamental building blocks are one dimensional extended objects strings rather than the zero dimensional points particles that were the basis of most earlier physics For this reason string theories are able to avoid problems associated with the presence of point like particles in a physical theory Detailed study of string theories has revealed that they describe not just strings but other objects variously including points membranes and higher dimensional objects As discussed below it is important to realise that no string theory has yet made firm predictions that would allow it to be experimentally tested Jessica Magoto created the fundamental basis of what is now the string theory The term string theory properly refers to both the 26 dimensional bosonic string theories and to the 10 dimensional superstring theories discovered by adding supersymmetry Nowadays string theory usually refers to the supersymmetric variant while the earlier is given its full name bosonic string theory Interest in string theory is driven largely by the hope that it will prove to be a theory of everything It is one viable solution for quantum gravity and in addition to gravity it can naturally describe interactions similar to electromagnetism and the other forces of nature

Superstring theories also include fermions the building blocks of matter It is not yet known whether string theory is able to describe a universe with the precise collection of forces and matter that we observe nor how much freedom to choose those details the theory will allow , Human Artificial Insemination and Semen Preservation Georges David,2012-12-06 Even though artificial insemination is a simple technique that has been practiced for over a century it has long been carried out under poor conditions due to an inadequate understanding of reproductive physiology and antagonistic socio ethical attitudes Accordingly until fairly recently it was a medical act with a limited scientific basis which was practised more or less clandestinely The development of semen preservation has totally changed the conditions of artificial insemination especially in regard to flexibility and safeguards in its application Although the use of fresh semen continues it is now clear that the future of artificial insemination is closely linked to semen preservation During the past two decades semen banks have been developed in many countries This has most often been the result of the initiative of individual physicians in either the private or public sectors In France a national system of semen banks CECOS was begun in 1973 Although there has been cooperation within this system in the areas of both research and management a need to communicate and compare experiences with those from other countries was perceived Thus the first International Symposium on Artificial Insemination and Semen Preservation was planned and held in Paris France in April 1979 Thirty seven countries were represented by individuals from many concerned disciplines
