Water Waves Equations on the Circle Massimiliano Berti, Jean-Marc Delort, 2018-11-02 The goal of this monograph is to prove that any solution of the Cauchy problem for the capillary gravity water waves equations in one space dimension with periodic even in space small and smooth enough initial data is almost globally defined in time on Sobolev spaces provided the gravity capillarity parameters are taken outside an exceptional subset of zero measure In contrast to the many results known for these equations on the real line with decaying Cauchy data one cannot make use of dispersive properties of the linear flow Instead a normal forms based procedure is used eliminating those contributions to the Sobolev energy that are of lower degree of homogeneity in the solution Since the water waves equations form a quasi linear system the usual normal forms approaches would face the well known problem of losses of derivatives in the unbounded transformations To overcome this after a parilinearization of the capillary gravity water waves equations we perform several paradifferential reductions to obtain a diagonal system with constant coefficient symbols up to smoothing remainders Then we start with a normal form procedure where the small divisors are compensated by the previous paradifferential regularization The reversible structure of the water waves equations and the fact that we seek solutions even in space guarantees a key cancellation which prevents the growth of the Sobolev norms of the solutions *Monetary Economics and Policy* Pierpaolo Benigno, 2025-01-07 A unified framework for understanding monetary policy including recent unprecedented interventions by central banks Over the past two decades monetary policy has been deployed in unprecedented ways as central banks attempted to mitigate the adverse consequences of the 2007 2008 financial crisis the COVID 19 global lockdown and recent inflationary surges In Monetary Economics and Policy Pierpaolo Benigno offers a new way to understand the potency and effectiveness of monetary policy presenting a unified modeling framework to analyze policy challenges posed by both paper and digital currency systems He investigates current theoretical and policy controversies drawing connections with historical themes in monetary economics Benigno examines how central banks control the value of their currency amid competition from cryptocurrencies and private money like securities discusses the desirability of inflation targeting for macroeconomic stabilization and explores theoretical grounds for the unconventional monetary policies seen in the recent period of zero nominal interest rates including forward guidance quantitative and credit easing and helicopter money He accompanies his analysis with an innovative visual representation of the New Keynesian model and inflation targeting policies Benigno s novel framework also allows the study of monetary policy normalization through quantitative tightening toward what has become the new normal He discusses the optimal provision of liquidity and the different roles of the government and financial intermediaries Finally he recounts historical controversies regarding the inflation unemployment trade off to understand the 2020s inflationary surge and
