manipulating the Object Services API's `ObjectContext`. It continues with demonstrating use of partial classes for the `ModelNameEntities` and `EntityName` objects executing eSQL `ObjectQuery`s and deferred or eager loading of associated entities including ordering and filtering the associated entities. Also covers instructions for composing `QueryBuilder` methods for `ObjectQuery`s LINQ to Entities queries and parameterizing `ObjectQuery`s. Updating Entities and Complex Types shows you how to perform create update and delete CUD operations on `EntitySets` and manage optimistic concurrency conflicts. It starts with a detailed description of the `ObjectContext`, `ObjectStateManager` and its child objects which perform object identification and change tracking operations with `EntityKeys`. This also covers validation of create and update operations optimizing the `DataContext` lifetime performing updates with stored procedures and working with complex types. Binding Data Controls to the `ObjectContext` describes creating design time data sources from `ObjectContext` `EntitySet` instances drag and drop addition of `BindingNavigator`, `BindingSource`, bound `TextBox` and `DataGridView` controls to Windows forms. You also learn how to update `EntityReference` and `EntitySet` values with `ComboBox` columns in `DataGridView` controls. You can't update `EntitySet` values directly you must delete and add a new member having the required value. This concludes with a demonstration of the use of the ASP.NET `EntityDataSource` control bound to `GridView` and `DropDownList` controls. Using the Entity Framework As a Data Source concentrates on using EF as a data source for the ADO.NET Data Services Framework the former codename Project Astoria remains in common use which is the preferred method for deploying EF v1 as a Web service provider. EF v2 is expected to be able to support n tier data access with Windows Communication Foundation (WCF) directly. A Windows form example uses Astoria's .NET 3.5 Client Library to display and update entity instances with the Atom Publication `AtomPub` or APP wire format. The Web form project uses the AJAX Client Library and JavaScript Object Notation (JSON) as the wire format.
