

JPAD (Java API for Aircraft Designers)

JPAD is an application programming interface (API) able to support civil transport aircraft designers to accomplish multi-disciplinary simulation-based analysis and optimization workflows.

The API is a Java software library containing classes and utility functions that can be used to build software systems running MCAD procedures.

JPAD comes in different interdependent software modules providing modeling, simulation, and analysis features.

Typical transport aircraft mission breakdown

The API provides a simulation-based aircraft performance module whose implementation details are introduced by this article.

This work focuses on take-off and landing simulation models, including certification noise trajectories.

The article presents an application example that considers the Airbus A320-300 as a reference aircraft and includes complete take-off and landing performance studies.

A320-300 balanced field length and decision speed calculation

A320-300 take-off rotation speed and take-off safety speed variations with engine failure speed

Take-off and landing trajectories & noise certification measurement points

Satofuka in appreciation of his contributions to this field. During the last 30 years Prof Satofuka made many important contributions to CFD and advancing the numerics and our understanding of flow physics in different regimes. The details of his contributions are discussed in the first chapter. The book contains chapters covering related topics with emphasis on new promising directions for the 21st Century. The chapters of the book reflect the 10 sessions of the symposium on both the numerics and the applications including grid generation and adaptation, new numerical schemes, optimization techniques and parallel computations as well as applications to multi-scale and multi-physics problems, design and flow control and new topics beyond aeronautics. In the following the chapters of the book are introduced.

Training Design in Aviation

Norman MacLeod, 2017-03-02. Well-structured training based on sound theoretical principles can transform the system in which high performance is essential and in turn the organisation. Yet the strategic role of cost-effective training provision is often less well understood than it might be in all branches of aviation, whether civil or regional, general business or military. This book analyzes the cycle of training design from the identification of requirement through to measurement of effectiveness. Key issues in training design and management are illustrated with examples and learning is consolidated through case studies. The book provides advice, tools, procedures and examples of best practice, both recent and well established, to assist aviation training personnel who aim to guarantee cost-effective training. The approach is highly practical but does not avoid covering the theory when needed. An informative guide to the process of training analysis and course design, the book examines each stage of the training design cycle in some depth. In addition, it looks at the application of quality management and of project management to training design. Each chapter contains advice and techniques as well as examples drawn from the author's wealth of experience of training in aviation.

A Cascade Optimization Strategy for

Solution of Difficult Multidisciplinary Design Problems, 1996. A research project to comparatively evaluate 10 nonlinear optimization algorithms was recently completed. A conclusion was that no single optimizer could successfully solve all 40 problems in the test bed, even though most optimizers successfully solved at least one third of the problems. We realized that improved search directions and step lengths available in the 10 optimizers compared were not likely to alleviate the convergence difficulties. For the solution of those difficult problems we have devised an alternative approach called cascade optimization strategy. The cascade strategy uses several optimizers, one followed by another in a specified sequence to solve a problem. A pseudorandom scheme perturbs design variables between the optimizers. The cascade strategy has been tested successfully in the design of supersonic and subsonic aircraft configurations and air-breathing engines for high-speed civil transport applications. These problems could not be successfully solved by an individual optimizer. The cascade optimization strategy, however, generated feasible optimum solutions for both aircraft and engine problems. This paper presents the cascade strategy and solutions to a number of these problems.
