Finite Element Analysis for Building Assessment Paulo B. Lourenço, Angelo Gaetani, 2022-05-23 Existing structures represent a heterogeneous category in the global built environment as often characterized by the presence of archaic materials damage and disconnections uncommon construction techniques and subsequent interventions throughout the building history In this scenario the common linear elastic analysis approach adopted for new buildings is incapable of an accurate estimation of structural capacity leading to overconservative results invasive structural strengthening added intervention costs excessive interference to building users and possible losses in terms of aesthetics or heritage values For a rational and sustainable use of the resources this book deals with advanced numerical simulations adopting a practical approach to introduce the fundamentals of Finite Element Method nonlinear solution procedures and constitutive material models Recommended material properties for masonry timber reinforced concrete iron and steel are discussed according to experimental evidence building standards and codes of practice The examples examined throughout the book and in the conclusive chapter support the analyst's decision making process toward a safe and efficient use of finite element analysis Written primarily for practicing engineers the book is of value to students in engineering and technical architecture with solid knowledge in the field of continuum mechanics and structural design
