2014 Mathematics Map Norms:

Operator and Norm Inequalities and Related Topics Richard M. Aron, Mohammad Sal Moslehian, Ilya M. Spitkovsky, Hugo J. Woerdeman, 2022-08-10 Inequalities play a central role in mathematics with various applications in other disciplines. The main goal of this contributed volume is to present several important matrix operator and norm inequalities in a systematic and self-contained fashion. Some powerful methods are used to provide significant mathematical inequalities in functional analysis, operator theory, and numerous fields in recent decades. Some chapters are devoted to giving a series of new characterizations of operator monotone functions, and some others explore inequalities connected to log majorization, relative operator entropy, and the Ando-Hiai inequality. Several chapters are focused on Birkhoff-James orthogonality and approximate orthogonality in Banach spaces and operator algebras such as C^* -algebras from historical perspectives to current development. A comprehensive account of the boundedness, compactness, and restrictions of Toeplitz operators can be found in the book. Furthermore, an overview of the Bishop-Phelps-Bollobás theorem is provided. The state of the art of Hardy-Littlewood inequalities in sequence spaces is given. The chapters are written in a reader-friendly style and can be read independently. Each chapter contains a rich bibliography. This book is intended for use by both researchers and graduate students of mathematics, physics, and engineering.

International Perspectives on Educational Administration using Educational Inquiry Abdulrasheed Olowoselu, Areej ElSayary, 2024-08-02 This edited volume sets out the current issues that face educational administrative processes and resources across the globe and provides implications, lead responses for how best to tackle new challenges that arise. Featuring contributions and perspectives from the UAE, Nigeria, Malaysia, Indonesia, Portugal, Spain, Iran, and the United States, this diverse and truly international volume discusses the management of resources, tasks, and communication, key to the smooth running of educational institutions. Divided into four distinct parts, the chapters examine educational administration from theoretical, conceptual, and empirical angles, focusing on theories, administrative procedures, decision support systems, and management techniques in educational administration, as well as reward management and digital leadership. This book bridges the gap in educational administration by showcasing new trends across many countries and examining the role of theory in the field using examples of classical and contemporary approaches, systems theory, leadership theory, and theories of change and innovation. Ultimately, presenting a problem-solving approach to the current educational administrative situation globally, this volume will be of interest to researchers, scholars, and faculty members involved with education administration research, educational administration theory, and leadership. Practitioners working on educational process improvement and organizational studies will also benefit from the volume.

Optimal Transport for Applied Mathematicians Filippo Santambrogio, 2015-10-17 This monograph presents a rigorous mathematical introduction to optimal transport as a variational problem, its use in modeling various phenomena, and its connections with partial differential equations. Its main goal is to provide the reader with the techniques necessary to understand the current

research in optimal transport and the tools which are most useful for its applications Full proofs are used to illustrate mathematical concepts and each chapter includes a section that discusses applications of optimal transport to various areas such as economics finance potential games image processing and fluid dynamics Several topics are covered that have never been previously in books on this subject such as the Knothe transport the properties of functionals on measures the Dacorogna Moser flow the formulation through minimal flows with prescribed divergence formulation the case of the supremal cost and the most classical numerical methods Graduate students and researchers in both pure and applied mathematics interested in the problems and applications of optimal transport will find this to be an invaluable resource

Geometry of Banach Spaces and Related Fields Gilles Godefroy, Mohammad Sal Moslehian, Juan Benigno

Seoane-Sepúlveda, 2024-03-27 This book provides a comprehensive presentation of recent approaches to and results about properties of various classes of functional spaces such as Banach spaces uniformly convex spaces function spaces and Banach algebras Each of the 12 articles in this book gives a broad overview of current subjects and presents open problems Each article includes an extensive bibliography This book is dedicated to Professor Per H Enflo who made significant contributions to functional analysis and operator theory *Handbook of Geometry and Topology of Singularities II* José Luis Cisneros-Molina, Dũng Tráng Lê, José Seade, 2021-11-01 This is the second volume of the Handbook of the Geometry and Topology of Singularities a series which aims to provide an accessible account of the state of the art of the subject its frontiers and its interactions with other areas of research This volume consists of ten chapters which provide an in depth and reader friendly survey of some of the foundational aspects of singularity theory and related topics Singularities are ubiquitous in mathematics and science in general Singularity theory interacts energetically with the rest of mathematics acting as a crucible where different types of mathematical problems interact surprising connections are born and simple questions lead to ideas which resonate in other parts of the subject and in other subjects Authored by world experts the various contributions deal with both classical material and modern developments covering a wide range of topics which are linked to each other in fundamental ways The book is addressed to graduate students and newcomers to the theory as well as to specialists who can use it as a guidebook **Lectures on General Quantum Correlations and their Applications**

Felipe Fernandes Fanchini, Diogo de Oliveira Soares Pinto, Gerardo Adesso, 2017-06-24 This book presents a distinctive way of understanding quantum correlations beyond entanglement introducing readers to this less explored yet very fundamental aspect of quantum theory It takes into account most of the new ideas involving quantum phenomena resources and applications without entanglement both from a theoretical and an experimental point of view This book serves as a reference for both beginner students and experienced researchers in physics and applied mathematics with an interest in joining this novel venture towards understanding the quantum nature of the world *Geometric Pressure for Multimodal Maps of the Interval* Feliks Przytycki, Juan Rivera-Letelier, 2019-06-10 This paper is an interval dynamics counterpart of three theories

founded earlier by the authors S Smirnov and others in the setting of the iteration of rational maps on the Riemann sphere the equivalence of several notions of non uniform hyperbolicity Geometric Pressure and Nice Inducing Schemes methods leading to results in thermodynamical formalism The authors work in a setting of generalized multimodal maps that is smooth maps f of a finite union of compact intervals I in $\mathbb{R}$ into $\mathbb{R}$ with non flat critical points such that on its maximal forward invariant set K the map f is topologically transitive and has positive topological entropy They prove that several notions of non uniform hyperbolicity of $f|_K$ are equivalent including uniform hyperbolicity on periodic orbits TCE all periodic orbits in K hyperbolic repelling Lyapunov hyperbolicity and exponential shrinking of pull backs They prove that several definitions of geometric pressure P_t that is pressure for the map $f|_K$ and the potential $t \log f$ give the same value including pressure on periodic orbits tree pressure variational pressures and conformal pressure Finally they prove that provided all periodic orbits in K are hyperbolic repelling the function P_t is real analytic for t between the condensation and freezing parameters and that for each such t there exists unique equilibrium and conformal measure satisfying strong statistical properties

Ergodic Theory of Expanding Thurston Maps Zhiqiang Li, 2017-04-06 Thurston maps are topological generalizations of postcritically finite rational maps This book provides a comprehensive study of ergodic theory of expanding Thurston maps focusing on the measure of maximal entropy as well as a more general class of invariant measures called equilibrium states and certain weak expansion properties of such maps In particular we present equidistribution results for iterated preimages and periodic points with respect to the unique measure of maximal entropy by investigating the number and locations of fixed points We then use the thermodynamical formalism to establish the existence uniqueness and various other properties of the equilibrium state for a Holder continuous potential on the sphere equipped with a visual metric After studying some weak expansion properties of such maps we obtain certain large deviation principles for iterated preimages and periodic points under an additional assumption on the critical orbits of the maps This enables us to obtain general equidistribution results for such points with respect to the equilibrium states under the same assumption

Expanding Thurston Maps Mario Bonk, Daniel Meyer, 2017-11-28 This monograph is devoted to the study of the dynamics of expanding Thurston maps under iteration A Thurston map is a branched covering map on a two dimensional topological sphere such that each critical point of the map has a finite orbit under iteration It is called expanding if roughly speaking preimages of a fine open cover of the underlying sphere under iterates of the map become finer and finer as the order of the iterate increases Every expanding Thurston map gives rise to a fractal space called its visual sphere Many dynamical properties of the map are encoded in the geometry of this visual sphere For example an expanding Thurston map is topologically conjugate to a rational map if and only if its visual sphere is quasisymmetrically equivalent to the Riemann sphere This relation between dynamics and fractal geometry is the main focus for the investigations in this work The book is an introduction to the subject The prerequisites for the reader are modest and include some basic knowledge of complex analysis and topology The book has an extensive

appendix where background material is reviewed such as orbifolds and branched covering maps *Sobolev Maps to the Circle* Haim Brezis, Petru Mironescu, 2022-01-01 The theory of real valued Sobolev functions is a classical part of analysis and has a wide range of applications in pure and applied mathematics By contrast the study of manifold valued Sobolev maps is relatively new The incentive to explore these spaces arose in the last forty years from geometry and physics This monograph is the first to provide a unified comprehensive treatment of Sobolev maps to the circle presenting numerous results obtained by the authors and others Many surprising connections to other areas of mathematics are explored including the Monge Kantorovich theory in optimal transport items in geometric measure theory Fourier series and non local functionals occurring for example as denoising filters in image processing Numerous digressions provide a glimpse of the theory of sphere valued Sobolev maps Each chapter focuses on a single topic and starts with a detailed overview followed by the most significant results and rather complete proofs The Complements and Open Problems sections provide short introductions to various subsequent developments or related topics and suggest new directions of research Historical perspectives and a comprehensive list of references close out each chapter Topics covered include lifting point and line singularities minimal connections and minimal surfaces uniqueness spaces factorization density Dirichlet problems trace theory and gap phenomena Sobolev Maps to the Circle will appeal to mathematicians working in various areas such as nonlinear analysis PDEs geometric analysis minimal surfaces optimal transport and topology It will also be of interest to physicists working on liquid crystals and the Ginzburg Landau theory of superconductors
