Sat Attack Maths Anne Frobisher, Len, 2004-12 SAT Attack Maths is the perfect 10 week revision programme for both independent and whole class maths teaching **A Concrete Introduction to Higher Algebra** Lindsay N.

Childs, 2012-12-04 This book is written as an introduction to higher algebra for students with a background of a year of calculus The first edition of this book emerged from a set of notes written in the 1970s for a sophomore junior level course at the University at Albany entitled Classical Algebra The objective of the course and the book is to give students enough experience in the algebraic theory of the integers and polynomials to appreciate the basic concepts of abstract algebra The main theoretical thread is to develop algebraic properties of the ring of integers unique factorization into primes congruences and congruence classes Fermat's theorem the Chinese remainder theorem and then again for the ring of polynomials Doing so leads to the study of simple field extensions and in particular to an exposition of finite fields Elementary properties of rings fields groups and homomorphisms of these objects are introduced and used as needed in the development Concurrently with the theoretical development the book presents a broad variety of applications to cryptography error correcting codes Latin squares tournaments techniques of integration and especially to elementary and computational number theory A student who asks Why am I learning this will find answers usually within a chapter or two For a first course in algebra the book offers a couple of advantages By building the algebra out of numbers and polynomials the book takes maximal advantage of the student's prior experience in algebra and arithmetic New concepts arise in a familiar context

Introduction to Quantitative Finance Robert R. Reitano, 2010-01-29 An introduction to many mathematical topics applicable to quantitative finance that teaches how to think in mathematics rather than simply do mathematics by rote This text offers an accessible yet rigorous development of many of the fields of mathematics necessary for success in investment and quantitative finance covering topics applicable to portfolio theory investment banking option pricing investment and insurance risk management The approach emphasizes the mathematical framework provided by each mathematical discipline and the application of each framework to the solution of finance problems It emphasizes the thought process and mathematical approach taken to develop each result instead of the memorization of formulas to be applied or misapplied automatically The objective is to provide a deep level of understanding of the relevant mathematical theory and tools that can then be effectively used in practice to teach students how to think in mathematics rather than simply to do mathematics by rote Each chapter covers an area of mathematics such as mathematical logic Euclidean and other spaces set theory and topology sequences and series probability theory and calculus in each case presenting only material that is most important and relevant for quantitative finance Each chapter includes finance applications that demonstrate the relevance of the material presented Problem sets are offered on both the mathematical theory and the finance applications sections of each chapter The logical organization of the book and the judicious selection of topics make the text customizable for a number of

courses The development is self contained and carefully explained to support disciplined independent study as well A solutions manual for students provides solutions to the book s Practice Exercises an instructor s manual offers solutions to the Assignment Exercises as well as other materials

Residuated Lattices: An Algebraic Glimpse at Substructural Logics Nikolaos Galatos, Peter Jipsen, Tomasz Kowalski, Hiroakira Ono, 2007-04-25 The book is meant to serve two purposes The first and more obvious one is to present state of the art results in algebraic research into residuated structures related to substructural logics The second less obvious but equally important is to provide a reasonably gentle introduction to algebraic logic At the beginning the second objective is predominant Thus in the first few chapters the reader will find a primer of universal algebra for logicians a crash course in nonclassical logics for algebraists an introduction to residuated structures an outline of Gentzen style calculi as well as some tidbits of proof theory the celebrated Hauptsatz or cut elimination theorem among them These lead naturally to a discussion of interconnections between logic and algebra where we try to demonstrate how they form two sides of the same coin We envisage that the initial chapters could be used as a textbook for a graduate course perhaps entitled Algebra and Substructural Logics As the book progresses the first objective gains predominance over the second Although the precise point of equilibrium would be difficult to specify it is safe to say that we enter the technical part with the discussion of various completions of residuated structures These include Dedekind McNeille completions and canonical extensions Completions are used later in investigating several finiteness properties such as the finite model property generation of varieties by their finite members and finite embeddability The algebraic analysis of cut elimination that follows also takes recourse to completions Decidability of logics equational and quasi equational theories comes next where we show how proof theoretical methods like cut elimination are preferable for small logics theories but semantic tools like Rabin's theorem work better for big ones Then we turn to Glivenko's theorem which says that a formula is an intuitionistic tautology if and only if its double negation is a classical one We generalise it to the substructural setting identifying for each substructural logic its Glivenko equivalence class with smallest and largest element This is also where we begin investigating lattices of logics and varieties rather than

particular examples We continue in this vein by presenting a number of results concerning minimal varieties maximal logics A typical theorem there says that for some given well known variety its subvariety lattice has precisely such and such number of minimal members where values for such and such include but are not limited to continuum countably many and two In the last two chapters we focus on the lattice of varieties corresponding to logics without contraction In one we prove a negative result that there are no nontrivial splittings in that variety In the other we prove a positive one that semisimple varieties coincide with discriminator ones Within the second more technical part of the book another transition process may be traced Namely we begin with logically inclined technicalities and end with algebraically inclined ones Here perhaps algebraic rendering of Glivenko theorems marks the equilibrium point at least in the sense that finiteness properties decidability and Glivenko theorems are of clear interest to logicians whereas semisimplicity and discriminator varieties are universal algebra par excellence It is for the reader to judge whether we succeeded in weaving these threads into a seamless fabric
