Delta-Sigma A/D-Converters Richard Gaggli, 2012-12-17 The emphasis of this book is on practical design aspects for broadband A/D converters for communication systems. The embedded designs are employed for transceivers in the field of ADSL solutions and WLAN applications. An area and power efficient realization of a converter is mandatory to remain competitive in the market. The right choice for the converter topology and architecture needs to be done very carefully to result in a competitive FOM. The book begins with a brief overview of basic concepts about ADSL and WLAN to understand the ADC requirements. At architectural level issues on different modulator topologies are discussed employing the provided technology node. The design issues are pointed out in detail for modern digital CMOS technologies beginning with 180nm followed by 130nm and going down to 65nm feature size. Beside practical aspects challenges to mixed signal design level are addressed to optimize the converters in terms of consumed chip area, power consumption and design for high yield in volume production. Thus careful considerations on circuit and architectural level are performed by introducing a dynamic biasing technique, a feed forward approach and a resolution in time instead of amplitude resolution. *Microtimes*, 1998

Forecasting the Internet David G. Loomis, L.D. Taylor, 2012-12-06 David O Loomis, Illinois State University. The explosive growth of the Internet has caught most industry experts off guard. While data communications was expected to be the wave of the future, few industry observers foresaw how rapid the change in focus from voice communications towards data would be. Understanding the data communications revolution has become an urgent priority for many in the telecommunications industry. Demand analysis and forecasting are critical tools to understanding these trends for both Internet access and Internet backbone service. Businesses have led residential customers in the demand for data services, but residential demand is currently increasing exponentially. Even as business demand for data communications is becoming better understood, residential broadband access demand is still largely unexplored. Cable modems and ADSL appear to be the current residential broadband choices, yet demand elasticities and econometric model based forecasts for these services are not currently available. The responsiveness of customers to price and income changes and customer's perceptions of the tradeoff in product characteristics between cable modems and ADSL is largely unknown. Demand for Internet access is derived from the demand for applications which utilize this access; access is not demanded independent of its usage. Thus it is important to understand Internet applications in order to understand the demand for access. **The Telecommunications**
