Mathematical Modelling with Differential Equations Ronald E. Mickens, 2022-05-23 Mathematical Modelling with Differential Equations aims to introduce various strategies for modelling systems using differential equations. Some of these methodologies are elementary and quite direct to comprehend and apply, while others are complex in nature and require thoughtful deep contemplation. Many topics discussed in the chapter do not appear in any of the standard textbooks, and this provides users an opportunity to consider a more general set of interesting systems that can be modelled. For example, the book investigates the evolution of a toy universe, discusses why alternate futures exist in classical physics, constructs approximate solutions to the famous Thomas Fermi equation using only algebra and elementary calculus, and examines the importance of truly nonlinear and oscillating systems. Features: Introduces, defines, and illustrates the concept of dynamic consistency as the foundation of modelling. Can be used as the basis of an upper level undergraduate course on general procedures for mathematical modelling using differential equations. Discusses the issue of dimensional analysis and continually demonstrates its value for both the construction and analysis of mathematical modelling. [Advanced Electromagnetic Models for Materials Characterization and Nondestructive Evaluation](#)

Harold A. Sabbagh, R. Kim Murphy, Elias H. Sabbagh, Liming Zhou, Russell Wincheski, 2021-03-19 This book expands on the subject matter of Computational Electromagnetics and Model Based Inversion: A Modern Paradigm for Eddy Current Nondestructive Evaluation. It includes a voxel based inversion method which are generalizations of model based algorithms, a complete electromagnetic model of advanced composites and other novel exotic materials stressing the highly anisotropic nature of these materials, as well as giving a number of applications to nondestructive evaluation, and c) an up to date discussion of stochastic integral equations and propagation of uncertainty models in nondestructive evaluation. As such, the book combines research started twenty five years ago in advanced composites and voxel based algorithms but published in scattered journal articles, as well as recent research in stochastic integral equations. All of these areas are of considerable interest to the aerospace, nuclear power, civil infrastructure, materials characterization, and biomedical industries. The book covers the topic of computational electromagnetics in eddy current nondestructive evaluation (NDE) by emphasizing three distinct topics: a) fundamental mathematical principles of volume integral equations as a subset of computational electromagnetics, b) mathematical algorithms applied to signal processing and inverse scattering problems, and c) applications of these two topics to problems in which real and model data are used. It is therefore more than an academic exercise and is valuable to users of eddy current NDE technology in industries as varied as nuclear power, aerospace, materials characterization, and biomedical imaging.
