Model-Driven Development of Reliable Automotive Services Manfred Broy, Ingolf Krüger, Michael Meisinger, 2008-07-17

Software development for the automotive domain has become the enabling technology for almost all safety critical and comfort functions owed to the customer. Ninety percent of all innovations in automotive systems are directly or indirectly enabled by embedded software. The numbers of serious accidents have declined in recent years despite constantly increasing traffic; this is correlated with the introduction of advanced software-enabled functionality for driver assistance such as electronic stability control. Software contributes significantly to the automotive value chain. By 2010 it is estimated that software will make up 40% of the value creation of automotive electronics. However, with the large number of software-enabled functions, their interactions and the corresponding networking and operating infrastructure come significant complexities both during the automotive systems engineering process and at runtime. A central challenge for automotive systems development is the scattering of functionality across multiple subsystems such as electronic control units (ECUs) and the associated networks. As an example, consider the central locking systems (CLS) whose functionality is spread out over up to 19 different ECUs in some luxury cars. Of course, this includes advanced functionality such as seat positioning and radio tuning according to driver presets upon entry as well as unlocking in case of a detected impact or accident. However, this example demonstrates that modern automotive systems bridge comfort and safety-critical functionality. This induces particular demands on safety and security and in general software and systems quality. The resulting challenges and opportunities were discussed in depth at the second Automotive Software Workshop San Diego (ASWSD 2006) on whose results we report here.
