Balaban, 2012-12-06 The application of magnetic resonance spectroscopy MRS to the cardiovascular system is a relatively new phenomenon Its ability to noninvasively examine myocardial metabolism has led to its use to answer basic questions in animal models of normal and diseased myocardium Extension of these investigations into the realm of human myocardial metabolism has been made possible by the advent of

relatively high field magnets with spectroscopy capabilities and sufficient bore dimensions to allow human studies While ongoing and future studies promise to enhance our understanding of myocardial metabolism their success will in part depend on a thorough understanding of the technical and biologic aspects of cardiovascular MRS as well as the current state of research in the many areas encompassed by this discipline It is with concept that the present monograph has been written The organization and content should lend this book to both the beginning reader who is interested but not conversant in cardiovascular MRS as well as to the active investigator who wishes to refer to a volume that deals with the many issues of this field in a concise but complete manner The monograph is structured with a general overview of the field followed by a section addressing the technical issues of cardiovascular MRS The next section is devoted to biologic issues of both normal and abnormal myocardial metabolism primarily devoted to investigations employing phosphorus 31 This is followed by a section dealing with more specialized issues generally involving other nuclei such as protons carbon and sodium Finally the clinical applications of cardiovascular MRS are addressed

3-D Imaging of Coronary Vessels Using C-arm CT Chris Schwemmer,2019-06-26 Cardiovascular disease has become the number one cause of death worldwide For the diagnosis and therapy of coronary artery disease interventional C arm based fluoroscopy is an imaging method of choice While these C arm systems are also capable of rotating around the patient and thus allow a CT like 3 D image reconstruction their long rotation time of about five seconds leads to strong motion artefacts in 3 D coronary artery imaging In this work a novel method is introduced that is based on a 2 D 2 D image registration algorithm It is embedded in an iterative algorithm for motion estimation and compensation and does not require any complex segmentation or user interaction It is thus fully automatic which is a very desirable feature for interventional applications The method is evaluated on simulated and human clinical data Overall it could be shown that the method can be successfully applied to a large set of clinical data without user interaction or parameter changes and with a high robustness against initial 3 D image quality while delivering results that are at least up to the current state of the art and better in many cases
