Microbes are ubiquitous in nature Among microbes fungal communities play an important role in agriculture the environment and medicine Vast fungal diversity has been associated with plant systems namely epiphytic fungi endophytic fungi and rhizospheric fungi These fungi associated with plant systems play an important role in plant growth crop yield and soil health Rhizospheric fungi present in rhizospheric zones get their nutrients from root exudates released by plant root systems which help with their growth development and microbe activity Endophytic fungi typically enter plant hosts through naturally occurring wounds that are the result of plant growth through root hairs or at epidermal junctions Phyllospheric fungi may survive or proliferate on leaves depending on material influences in leaf diffuseness or exudates The diverse nature of these fungal communities is a key component of soil plant systems where they are engaged in a network of interactions endophytically phyllospherically as well as in the rhizosphere and thus have emerged as a promising tool for sustainable agriculture These fungal communities promote plant growth directly and indirectly by using plant growth promoting PGP attributes These PGP fungi can be used as biofertilizers and biocontrol agents in place of chemical fertilizers and pesticides for a more eco friendly method of promoting sustainable
