Drawing Futures Bob Sheil,Frédéric Migayrou,Luke Pearson,Laura Allen,2016-11-11 Drawing Futures brings together international designers and artists for speculations in contemporary drawing for art and architecture Despite numerous developments in technological manufacture and computational design that provide new grounds for designers the act of drawing still plays a central role as a vehicle for speculation There is a rich and long history of drawing tied to innovations in technology as well as to revolutions in our philosophical understanding of the world In reflection of a society now underpinned by computational networks and interfaces allowing hitherto unprecedented views of the world the changing status of the drawing and its representation as a political act demands a platform for reflection and innovation Drawing Futures will present a compendium of projects writings and interviews that critically reassess the act of drawing and where its future may lie Drawing Futures focuses on the discussion of how the field of drawing may expand synchronously alongside technological and computational developments The book coincides with an international conference of the same name taking place at The Bartlett School of Architecture UCL in November 2016 Bringing together practitioners from many creative fields the book discusses how drawing is changing in relation to new technologies for the production and dissemination of ideas

Pixels & Paintings David G. Stork,2023-11-14 PIXELS PAINTINGS The discussion is firmly grounded in established art historical practices such as close visual analysis and an understanding of artists working methods and real world examples demonstrate how computer assisted techniques can complement traditional approaches Dr Emilie Gordenker Director of the Van Gogh Museum The pioneering presentation of computer based image analysis of fine art forging a dialog between art scholars and the computer vision community In recent years sophisticated computer vision graphics and artificial intelligence algorithms have proven to be increasingly powerful tools in the study of fine art These methods some adapted from forensic digital photography and others developed specifically for art empower a growing number of computer savvy art scholars conservators and historians to answer longstanding questions as well as provide new approaches to the interpretation of art Pixels Paintings provides the first and authoritative overview of the broad range of these methods which extend from image processing of palette marks brush strokes and shapes up through analysis of objects poses style composition to the computation of simple interpretations of artworks This book stresses that computer methods for art analysis must always incorporate the cultural contexts appropriate to the art studies at hand a blend of humanistic and scientific expertise Describes powerful computer image analysis methods and their application to problems in the history and interpretation of fine art Discusses some of the art historical lessons and revelations provided by the use of these methods Clarifies the assumptions and applicability of methods and the role of cultural contexts in their use Shows how computation can be used to analyze tens of thousands of artworks to reveal trends and anomalies that could not be found by traditional non computer

The Geometry of an Art Kirsti Andersen,2008-11-23 Key Issues ever since the late 1970s when Pia Holdt a student of mine at the time and Jed Buchwald a colleague normally working in another field made me aware of how fascinating the

history of perspective constructions is I have wanted to know more My studies have resulted in the present book in which I am mainly concerned with describing how the understanding of the geometry behind perspective developed and how and to what extent new insights within the mathematical theory of perspective influenced the way the discipline was presented in textbooks In order to throw light on these aspects of the history of perspective I have chosen to focus upon a number of key questions that I have divided into two groups Questions Concerning the History of Geometrical Perspective How did geometrical constructions of perspective images emerge How were they understood mathematically How did the geometrical constructions give rise to a mathematical theory of perspective How did this theory evolve In connection with the last question it is natural to take up the following themes

Constant-Scale Natural Boundary Mapping to Reveal Global and Cosmic Processes Pamela Elizabeth Clark, Chuck Clark, 2013-09-06 Whereas conventional maps can be expressed as outward expanding formulae with well defined central features and relatively poorly defined edges Constant Scale Natural Boundary CSNB maps have well defined boundaries that result from natural processes and thus allow spatial and dynamic relationships to be observed in a new way useful to understanding these processes CSNB mapping presents a new approach to visualization that produces maps markedly different from those produced by conventional cartographic methods In this approach any body can be represented by a 3D coordinate system For a regular body with its surface relatively smooth on the scale of its size locations of features can be represented by definite geographic grid latitude and longitude and elevation or deviation from the triaxial ellipsoid defined surface A continuous surface on this body can be segmented its distinctive regional terranes enclosed and their inter relationships defined by using selected morphologically identifiable relief features e g continental divides plate boundaries river or current systems In this way regions of distinction on a large essentially spherical body can be mapped as two dimensional facets with their boundaries representing regional to global scale asymmetries e g continental crust continental and oceanic crust on the Earth farside original thicker crust and nearside thinner impact punctuated crust on the Moon In an analogous manner an irregular object such as an asteroid with a surface that is rough on the scale of its size would be logically segmented along edges of its impact generated faces Bounded faces are imagined with hinges at occasional points along boundaries resulting in a foldable shape model Thus bounded faces grow organically out of the most compelling natural features Obvious boundaries control the map's extremities and peripheral regions are not dismembered or grossly distorted as in conventional map projections 2D maps and 3D models grow out of an object's most obvious face or terrane edges instead of arbitrarily by imposing a regular grid system or using regularly shaped facets to represent an irregular surface
