companion book or revise for examinations Lecturers may find some of the questions useful as a template when setting questions of their own but should note that the questions are primarily educational in intent their discriminatory power has not been tested The questions are grouped under the same headings as the chapters of the companion textbook so they become progressively more advanced see Contents Occasional statements call for information from later chapters Medically relevant questions are introduced wherever they are appropriate I have set at least one question on each learning objective given at the start of the chapter in the companion volume to help you assess your achievement of the learning objectives Some questions require you to integrate information from other chapters too The questions aim to test basic understanding fundamental principles and medical relevance Hopefully they avoid excessive detail always the examiner's easy option The questions Most of the questions are multiple choice questions MCQs generally with five true false statements but occasionally more or less than five Although some educationalists now demand single correct answer questions SAQs one correct answer out of four or five options these test less knowledge so the MCQ style has been retained here To add variety there is a sprinkling of other styles of question such as extended matching questions i.e. choose the best answer from a list data interpretation problems and little numerical problems that test reasoning power and ability to do simple calculations The answers Each answer is accompanied by a brief explanation and very often an illustrative figure which should help if you got the answer wrong Most of the figures are from the accompanying textbook but there are also new explanatory diagrams after some questions It is sometimes difficult to avoid ambiguity in MCQ questions so use your common sense choose the answer that will be right most of the time rather than a remote rare possibility Nevertheless if you disagree with the official answer do let me know

Cardiovascular System Mark E. Oberfield, Thomas A. Speiser, 2014 The essential components of the human cardiovascular system are the heart blood and blood vessels It includes pulmonary circulation a loop through the lungs where blood is oxygenated and systemic circulation a loop through the rest of the body to provide oxygenated blood In this book the authors present topical research in the study of the cardiovascular system and its anatomy and physiology short and long term effects of exercise and abnormalities Topics discussed include erythropoietin cell signaling and diseases cardiovascular morbidities in rheumatoid arthritis and the effects of exercise on cardiac autonomic function heart rate variability HRV assessment of physical training effects on autonomic cardiac control endoplasmic reticulum stress in cardiovascular disease and renal sympathetic denervation for resistant hypertension
