Analyse how two body systems interrelate to perform a named function/functions. Even though the systems may seem very separate in their activities the digestive system and respiratory system both contribute to work together. The systems cannot work by themselves as they both provide the materials needed throughout the body. They supply energy to all the cells throughout the body. The respiratory system and digestive system allow each other to function.

The digestive system is made up of all different organs which starts at the mouth and finishes at the anus but on the way involves all other organs; these organs help to break down and absorb the food. Our bodies need food as this is what helps us to do everyday tasks. The food we eat once in our body is used for growth repair, cell function, heart function, warmth and breathing. If we don't eat enough food then people will find that they are lethargic and find everyday tasks very difficult for example; running, as the body has no energy from food they will get tired quickly and their stamina will decrease and they will feel breathless. It's not only the energy that the body needs from the food it's also some chemicals as these certain chemicals help to maintain the bodies organs and keep them healthy .

Food and drink that we consume must be made into smaller molecules of nutrients by the body so it can be used for energy. The nutrient from the food goes into the veins and then it diffuses into the cells and is then transported around the body through the blood stream. The cell walls are 1 cell thick as then it allows the process of diffusion to occur.

The digestive system takes in food from your environment and then breaks it down to smaller molecules. Through the process of digestion, your body breaks large nutrient molecules into even smaller molecules; these smaller molecules enter the intestine and are then absorbed into the bloodstream. The cells then take these molecules and use them so the body can build new molecules that then go on to provide the cells energy needs and also for storage within the cells.

The digestive system is dependent on the respiratory system as it needs the respiratory system for it to work correctly. The digestive tract which includes the mouth, pharynx, oesophagus, stomach etc. uses muscles to make it contract so that the food can be broken up and also to move the food along the tract. Some of the muscles in the stomach turn the food into a liquid and then muscle contractions from the small intestine move it through the rest of the system. In order for these muscles to work in the way they do they need oxygen, therefore without the respiratory system the muscles would not be able to work. Also the respiratory system removes all carbon dioxide and water that the cells produce as a waste product.

The respiratory system's main function is to supply the blood with the oxygen it needs to transport around the body to all of th
