Microorganisms are important participants in supporting the functionality and diversity of terrestrial ecosystems. The microbial community is a key component that determines the structure, function, and complex processes of terrestrial ecosystems. The patterns and mechanisms of microbial community structure and function with respect to geographical scales and environmental changes have always been a focal and hot topic in environmental microbiology, ecology, and geography research. However, with the intensification of climate change and changes caused by other human activities, the ability of terrestrial ecosystems to withstand disturbances and maintain their functionality is increasingly being put to the test. The role and changes of terrestrial ecosystem microorganisms in addressing this issue have become a global focus and challenge for research.

Kumar, 2024-03-20 **Gut Microbiota's Role in High-Altitude Animal Adaptation** Wei Zhu, Kashif Ur Rehman, Lin Zhang, Huan

Li, 2025-06-17 High altitude environments present unique challenges for animal life due to extreme conditions such as low oxygen levels, high UV radiation, and significant temperature fluctuations. These factors create intense selection pressures, making high altitude regions ideal for studying evolutionary adaptation. Recent research has made strides in understanding the mechanisms behind high altitude adaptation, yet many questions remain unanswered. One emerging area of interest is the role of gut microbiota in these adaptations. Animals and their gut microbiota have co-evolved, forming mutualistic relationships that are crucial for various life activities, including digestion, metabolism, and immunity. The gut microbiota also plays a significant role in environmental adaptation and ecological differentiation. Despite the growing recognition of its importance, the specific contributions of gut microbiota to high altitude adaptation are not fully understood, highlighting a critical gap in current research.
