Chinese Industrial Espionage William C. Hannas, James Mulvenon, Anna B. Puglisi, 2013-06-14 This new book is the first full account inside or outside government of China's efforts to acquire foreign technology Based on primary sources and

meticulously researched the book lays bare China's efforts to prosper technologically through others' achievements. For decades China has operated an elaborate system to spot foreign technologies, acquire them by all conceivable means and convert them into weapons and competitive goods without compensating the owners. The director of the US National Security Agency recently called it the greatest transfer of wealth in history. Written by two of America's leading government analysts and an expert on Chinese cyber networks, this book describes these transfer processes comprehensively and in detail, providing the breadth and depth missing in other works. Drawing upon previously unexploited Chinese language sources, the authors begin by placing the new research within historical context before examining the People's Republic of China's policy support for economic espionage, clandestine technology transfers, theft through cyberspace and its impact on the future of the US. This book will be of much interest to students of Chinese politics, Asian security studies, US defence, US foreign policy and IR in general.

Performance-Driven Surrogate Modeling of High-Frequency Structures Slawomir Koziel, Anna Pietrenko-Dabrowska, 2020-02-19. This book discusses surrogate modeling of high frequency structures including antenna and microwave components. The focus is on constrained or performance driven surrogates. The presented techniques aim at addressing the limitations of conventional modeling methods pertinent to the issues of dimensionality and parameter ranges that need to be covered by the surrogate to ensure its design utility. Within performance driven methodologies, mitigation of these problems is achieved through appropriate confinement of the model domain focused on the regions promising from the point of view of the relevant design objectives. This enables the construction of reliable surrogates at a fraction of cost required by conventional methods and to accomplish the modeling tasks where other techniques routinely fail. The book provides a broad selection of specific frameworks extensively illustrated using examples of real world microwave and antenna structures along with numerous design examples. Furthermore, the book contains introductory material on data driven and physics based surrogates. The book will be useful for the readers working in the area of high frequency electronics including microwave engineering, antenna design, microwave photonics, magnetism, especially those that utilize electromagnetic (EM) simulation models in their daily routines. Covers performance driven and constrained modeling methods not available in other books to date. Discusses a wide range of practical case studies including a variety of microwave and antenna structures. Includes design applications of the presented modeling frameworks including single and multi objective parametric optimization.
