Introduction: Pedagogical and evaluative competencies for the 21st century are essential in molecular biology. Literature suggests that teaching methods should assess both knowledge and disciplinary skills, as this approach is a prerequisite for student employability in biomolecular sciences.

Methods: In this systematic review, we conducted a search in Web of Science and Scopus, selecting 55 studies that met the inclusion criteria for the development of this research. The keywords used in WoS and Scopus were “molecular biology” and “students,” limited to articles published between 2020 and 2024.

Results: This study identified a set of key competencies for the practice of molecular biology. However, it was observed that other equally relevant competencies received less attention in the analyzed reports. Honors programs implemented by universities promote innovative methodologies and technologies to enhance academic performance in molecular biology. These programs also encourage active teaching, which fosters students’ overall development.

Conclusion: The most frequently noted molecular biology competencies were critical thinking, collaboration, problem-solving, communication, and creativity. In contrast, other important skills such as research, reading, self-directed learning, motivation, and digital literacy were less emphasized, despite their relevance and connection to honors programs. In terms of teaching modalities, the face-to-face laboratory teaching was the most highly valued for its practical approach, followed by the hybrid approach. The traditional mode ranked third, while the virtual mode, despite its advantages, came in fourth. Desktop-based exams predominate as an evaluative tool, but there is a gap in this approach, since all the evaluation tools detected in this study mainly measure theoretical knowledge, omitting competency evaluation. This contradiction is relevant, as today’s employers demand precisely such competencies. Implementing honors programs is one way to address this gap by focusing on developing skills that align with current labor demands.

Genomics in Aquaculture to Better Understand Species Biology and Accelerate Genetic Progress José Manuel Yáñez, Ross Houston, Scott Newman, 2016-09-15

From a global perspective aquaculture is an activity related to food production with large potential for growth Considering a continuously growing population the efficiency and sustainability of this activity will be crucial to meet the needs of protein for human consumption in the near future However for continuous enhancement of the culture of both fish and shellfish there are still challenges to overcome mostly related to the biology of the cultured species and their interaction with increasingly changing environmental factors Examples of these challenges include early sexual maturation feed meal replacement immune response to infectious diseases and parasites and temperature and salinity tolerance Moreover it is estimated that less than 10% of the total aquaculture production in the world is based on populations genetically improved by means of artificial

selection Thus there is considerable room for implementing breeding schemes aimed at improving productive traits having significant economic impact By far the most economically relevant trait is growth rate which can be efficiently improved by conventional genetic selection i e based on breeding values of selection candidates However there are other important traits that cannot be measured directly on selection candidates such as resistance against infectious and parasitic agents and carcass quality traits e g fillet yield and meat color However these traits can be more efficiently improved using molecular tools to assist breeding programs by means of marker assisted selection using a few markers explaining a high proportion of the trait variation or genomic selection using thousands of markers to estimate genomic breeding values The development and implementation of new technologies applied to molecular biology and genomics such as next generation sequencing methods and high throughput genotyping platforms are allowing the rapid increase of availability of genomic resources in aquaculture species These resources will provide powerful tools to the research community and will aid in the determination of the genetic factors involved in several biological aspects of aquaculture species In this regard it is important to establish discussion in terms of which strategies will be more efficient to solve the primary challenges that are affecting aquaculture systems around the world The main objective of this Research Topic is to provide a forum to communicate recent research and implementation strategies in the use of genomics in aquaculture species with emphasis on 1 a better understanding of fish and shellfish biological processes having considerable impact on aquaculture systems and 2 the efficient incorporation of molecular information into breeding programs to accelerate genetic progress of economically relevant traits

Wireless Sensor Networks Hossam Mahmoud Ahmad Fahmy, 2016-03-02 This book focuses on the principles of wireless sensor networks WSNs their applications and their analysis tools with meticulous attention paid to definitions and terminology This book presents the adopted technologies and their manufacturers in detail making WSNs tangible for the reader In introductory computer networking books chapter sequencing follows the bottom up or top down architecture of the 7 layer protocol This book addresses subsequent steps in this process both horizontally and vertically thus fostering a clearer and deeper understanding through chapters that elaborate on WSN concepts and issues With such depth this book is intended for a wide audience it is meant to be a helper and motivator for senior undergraduates postgraduates researchers and practitioners It lays out important concepts and WSN relate applications uses appropriate literature to back research and practical issues and focuses on new trends Senior undergraduate students can use it to familiarize themselves with conceptual foundations and practical project implementations For graduate students and researchers test beds and simulators provide vital insights into analysis methods and tools for WSNs Lastly in addition to applications and deployment practitioners will be able to learn more about WSN manufacturers and components within several platforms and test beds
