

The human skeleton is composed of 206 bones, which are divided into the axial skeleton (skull, spine, and rib cage) and the appendicular skeleton (arms and legs). The bones are made of a hard, mineralized tissue called bone, which is composed of organic and inorganic components. The organic component is made of collagen, which gives the bone its flexibility. The inorganic component is made of calcium phosphate, which gives the bone its hardness. The bones are connected to each other by joints, which allow for movement. The joints are made of cartilage, which is a soft, flexible tissue. The cartilage is made of a network of collagen fibers and proteoglycan molecules. The proteoglycan molecules are made of a sugar and a protein. The sugar is called chondroitin, and the protein is called collagen. The cartilage is also made of water, which gives it its soft, gel-like consistency. The bones and joints work together to support the body and allow for movement.
