## Functions of the Nervous System

To carry out its normal role, the nervous system has three overlapping functions.

1. **Monitoring changes.** Much like a sentry, it uses its millions of sensory receptors to monitor changes occurring both inside and outside the body; these changes are called stimuli, and the gathered information is called sensory input.
2. **Interpretation of sensory input.** It processes and interprets the sensory input and decides what should be done at each moment, a process called *integration*.
3. **Effects responses.** It then effects a response by activating muscles or glands (effectors) via motor output.
4. **Mental activity.** The brain is the center of mental activity, including consciousness, thinking, and *memory*.
5. **Homeostasis.** This function depends on the ability of the nervous system to detect, interpret, and respond to changes in internal and external conditions. It can help stimulate or inhibit the activities of other systems to help maintain a constant internal environment.
