intermediate price level for production with a given technology. Mathematically, the technology is called *factor price independent* if and only if price level is separable from the technology itself. This is a good guide to the feasibility of the current generalization of profit maximization. In addition, you will see the relationship between profit maximization and profit cost minimization and how it is determined.

One important class of chemical reactions is double-displacement reactions. These occur when elements (and) compounds undergo trading or replacing ions. For example, in the following double-displacement reaction, the products are:

The next two theories concern how these "hidden" factors are related to the observed and unobserved factor components. The latent factors that correspond to the  $k$  unobserved variables arise from the variance-covariance and the means of the observed measurements or directly represent variables, or are related to them in a theoretically meaningful way and appear as a consequence. In the case of the measurement model, a dimension is linked to the observed variables. In some models, dimension structures, such as the structure of a hierarchical model, a group factor, or a general factor, are assumed as an a priori structure.
