Formal Concept Analysis FCA is a mathematical theory of concepts and conceptual hierarchy leading to methods for conceptually analyzing data and knowledge. The theory itself strongly relies on order and lattice theory which has been studied by mathematicians over decades. FCA proved itself highly relevant in several applications from the beginning and over the last years the range of applications has kept growing. The main reason for this comes from the fact that our modern society has turned into an information society. After years and years of using computers, companies realized they had stored gigantic amounts of data. Then they realized that this data, just rough information for them, might become a real treasure if turned into knowledge. FCA is particularly well suited for this purpose. From relational data, FCA can extract implications, dependencies, concepts, and hierarchies of concepts and thus capture part of the knowledge hidden in the data. The ICFCFA conference series gathers researchers from all over the world, being the main forum to present new results in FCA and related fields. These results range from theoretical novelties to advances in FCA-related algorithmic issues as well as application domains of FCA. ICFCFA 2008 was in the same vein as its predecessors: high quality papers and presentations, the place of real debate and exchange of ideas. ICFCFA 2008 contributed to strengthening the links between theory and applications. The high quality of the presentations was the result of the remarkable work of the authors and the reviewers. We wish to thank the reviewers for all their valuable comments which helped the authors to improve their presentations.

Foundations of Location Analysis H. A. Eiselt, Vladimir Marianov, 2011-01-13 Location analysis has matured from an area of theoretical inquiry that was designed to explain observed phenomena to a vibrant field which can be and has been used to locate items as diverse as landfills, fast food outlets, gas stations, as well as politicians and products in issue and feature spaces. Modern location science is dealt with by a diverse group of researchers and practitioners in geography, economics, operations research, industrial engineering, and computer science. Given the tremendous advances location science has seen from its humble beginnings, it is time to look back. The contributions in this volume were written by eminent experts in the field, each surveying the original contributions that created the field and then providing an up-to-date review of the latest contributions. Specific areas that are covered in this volume include: The three main fields of inquiry: minimax and minimin problems and covering models; Nonstandard location models including those with competitive components; models that locate undesirable facilities; models with probabilistic features and problems that allow interactions between facilities. Descriptions and detailed examinations of exact techniques including the famed Weiszfeld method and heuristic methods ranging from Lagrangean techniques to Greedy algorithms. A look at the spheres of influence that the facilities generate and that attract customers to them, a topic crucial in planning retail facilities. The theory of central places, which other than in mathematical games where location science was born.
