

THE SKELETON
 The skeleton is the framework of the body, supporting the soft parts and protecting the internal organs. It is composed of 206 bones, which are joined together at joints. The bones are divided into long bones, short bones, and irregular bones. The skull, spine, and ribcage are part of the axial skeleton, while the rest of the bones are part of the appendicular skeleton.

BONES
 Bones are made of living tissue and are constantly being renewed. They are composed of a hard, mineralized matrix and a soft, organic matrix. The hard matrix is made of calcium phosphate and calcium hydroxide, while the soft matrix is made of collagen and other proteins.

MUSCLES
 Muscles are made of muscle fibers, which are long, cylindrical cells. They are attached to bones at joints and contract to produce movement. There are three types of muscle: skeletal, smooth, and cardiac. Skeletal muscles are under voluntary control, while smooth and cardiac muscles are under involuntary control.

MUSCLE FIBERS
 Muscle fibers are multinucleated cells. They contain myofibrils, which are the contractile units of the muscle. The myofibrils are made of actin and myosin filaments. The actin filaments are attached to the Z-discs, and the myosin filaments are attached to the actin filaments. The myosin filaments pull the actin filaments towards the center of the sarcomere, causing the muscle to contract.

CONTRACTION
 Contraction is the process by which a muscle fiber shortens. It is caused by the interaction of actin and myosin filaments. The myosin filaments pull the actin filaments towards the center of the sarcomere, causing the muscle to contract.

MUSCLE METABOLISM
 Muscles require energy to contract. This energy is provided by the breakdown of ATP. ATP is broken down into ADP and inorganic phosphate, which releases energy. This energy is used to power the contraction of the muscle fiber.

MUSCLE ADAPTATION
 Muscles can adapt to different levels of activity. Regular exercise causes the muscle fibers to become larger and more numerous. This is called hypertrophy. Hypertrophy is caused by an increase in the size of the muscle fibers and an increase in the number of muscle fibers.

MUSCLE FIBER STRUCTURE
 A muscle fiber is a long, cylindrical cell. It contains many nuclei and mitochondria. The myofibrils are arranged in a regular, repeating pattern. The myofibrils are made of actin and myosin filaments. The actin filaments are attached to the Z-discs, and the myosin filaments are attached to the actin filaments.

MUSCLE METABOLISM
 Muscles require energy to contract. This energy is provided by the breakdown of ATP. ATP is broken down into ADP and inorganic phosphate, which releases energy. This energy is used to power the contraction of the muscle fiber.
