Neural Network Data Analysis Using SimulnetTM Edward J. Rzempoluck,2012-12-06 Scope of this Text This text is intended to provide the reader with an introduction to the analysis of numerical data using neural networks Neural networks as data analytic tools allow data to be analyzed in order to discover and model the functional relationships among the recorded variables Such data may be empirical It may originate in an experiment in which the values of one or more dependent variables are recorded as one or more independent variables are manipulated Alternatively the data may be observational rather than empirical in nature representing historical records of the behavior of some set of variables An example would be the values of a number of financial commodities such as stocks or bonds Finally the data may originate in a computational model of some physical process Instead of recording variables of the physical process the computer model

could be run to generate an artificial analog of the physical data. Since data in virtually any native form can be expressed in numerical format, the scope of the analytical techniques and procedures that will be presented in this text is essentially unlimited. Sources of data include research work in a range of disciplines as diverse as neuroscience, biomedicine, geophysics, psychology, sociology, archeology, economics, and astrophysics. An often fruitful approach to data analysis involves the use of neural network functions.
