Bruce King, 1992-12-01 Applications of Graph Theory and Topology in Inorganic Cluster and Coordination Chemistry is a text reference that provides inorganic chemists with a rudimentary knowledge of topology graph theory and related mathematical disciplines The book emphasizes the application of these topics to metal clusters and coordination compounds The book's initial chapters present background information in topology graph theory and group theory explaining how these topics relate to the properties of atomic orbitals and are applied to coordination polyhedra Subsequent chapters apply these ideas to the structure and chemical bonding in diverse types of inorganic compounds including boron cages metal clusters solid state materials metal oxide derivatives superconductors icosahedral phases and carbon cages fullerenes The book's final chapter introduces the application of topology and graph theory for studying the dynamics of rearrangements in coordination and cluster polyhedra *Algebraic Geometry for Coding Theory and Cryptography* Everett W. reviewed and revised each of this volume's five papers achieves the conference's goal of using algebraic geometry to address a problem in either coding theory or cryptography. Proposed variants of the McEliece cryptosystem based on different constructions of codes, constructions of locally recoverable codes from algebraic curves and surfaces, and algebraic approaches to the multicast network coding problem are only some of the topics covered in this volume. Researchers and graduate level students interested in the interactions between algebraic geometry and both coding theory and cryptography will find this volume valuable.
