

- A particular colour is produced by reflection of some and absorption of other components of white light.
- Three types
 - Isochromatic → having a characteristic fairly constant colour.
 - Anisochromatic → having a variable colour.
 - Pseudochromatic → showing a false colour.
- Some colourless minerals → quartz, calcite, diamond & zircon.

• Lustre

- It is the shine of a mineral.
- It is intensity of reflection of light from the mineral surface.
- Depends on three factors
 - Refractive index of the mineral
 - Absorption capacity
 - Nature of reflecting surface
- Types
 - Metallic
 - Non-metallic
- Metallic lustre → high density, high refractive index and opaque minerals e.g. pyrite.
- Non-metallic lustre → reflection very weak.
- Lustre is entirely independent of colour of the mineral.

• Streak

- Streak is the colour of the finely powdered mineral or obtained by scratching or rubbing the mineral over a rough unglazed porcelain plate.
- The plate is named as streak plate.
- Colourless and transparent minerals will always give a colourless streak.
- Coloured and opaque minerals typically give characteristic streaks quite different from other similarly looking minerals.
