

FOUR STROKE ENGINE

© 2008 ENGINELEARNER.COM

The four stroke engine is the most common type of internal combustion engine. It is used in a wide range of applications from small model engines to large marine engines. The four stroke cycle consists of four distinct strokes: intake, compression, combustion, and exhaust. Each stroke is performed by one of the two valves (intake and exhaust) and the piston. The piston is connected to the crankshaft, which converts the linear motion of the piston into rotational motion.

During the compression stroke, the air is compressed into a smaller volume, increasing its temperature and pressure. This prepares the air for the combustion stroke.
