

B2 2.1 Photosynthesis

In-text questions	A An organism that makes its own food. B carbon dioxide + water → glucose + oxygen C chloroplasts
Activity	Hypothesis Credit hypotheses along the lines of: If a plant is placed in the dark for a week, photosynthesis will decrease/glucose and oxygen will not be produced. Students should include a suitable plan for testing this hypothesis. Definitions Producer – organism that makes its own food. Consumer – organism that has to eat other organisms to gain energy. Photosynthesis – process where plants make their own food.
Summary questions	1 algae, producers, photosynthesis, carbon dioxide, glucose, light (6 marks) 2 Photosynthesis provides energy for plants to grow. Animals cannot make their own food. Animals have to eat plants to gain energy. (3 marks) 3a Yes because sunlight is available. (1 mark) b No because no sunlight is available. (1 mark) c No because there is no sunlight. There are no chloroplasts in the root hair cells. (2 marks) 4 QWC question (6 marks). Example answers: Carbon dioxide and water are the reactants. Carbon dioxide enters through the stomata in the leaves. Water enters through root/root hair cells by diffusion/osmosis. Water travels up the xylem to leaves (transpiration). Light is also required for photosynthesis to occur. Light is trapped in chlorophyll/chloroplasts in leaf cells. Oxygen and glucose are the products. Oxygen comes out through stomata. Glucose is taken to all cells in the plant (via the phloem). The plant cells use glucose to provide energy.

B2 2.2 Leaves

In-text questions	A They contain chlorophyll. B top of the leaf C To reduce evaporation of water. D They allow gases to diffuse into and out of the leaf. They close to prevent water loss.
Activity	Observing stomata For the labelled diagram of the underside of a leaf, labels should include: stomata, guard cells, veins, and, possibly, the waxy cuticle.

A Biologist's Guide to Mathematical Modeling in Ecology and Evolution Sarah P. Otto, Troy Day, 2011-09-19 Thirty years ago biologists could get by with a rudimentary grasp of mathematics and modeling Not so today In seeking to answer fundamental questions about how biological systems function and change over time the modern biologist is as likely to rely on sophisticated mathematical and computer based models as traditional fieldwork In this book Sarah Otto and Troy Day provide biology students with the tools necessary to both interpret models and to build their own The book starts at an elementary level of mathematical modeling assuming that the reader has had high school mathematics

and first year calculus Otto and Day then gradually build in depth and complexity from classic models in ecology and evolution to more intricate class structured and probabilistic models The authors provide primers with instructive exercises to introduce readers to the more advanced subjects of linear algebra and probability theory Through examples they describe how models have been used to understand such topics as the spread of HIV chaos the age structure of a country speciation and extinction Ecologists and evolutionary biologists today need enough mathematical training to be able to assess the power and limits of biological models and to develop theories and models themselves This innovative book will be an indispensable guide to the world of mathematical models for the next generation of biologists A how to guide for developing new mathematical models in biology Provides step by step recipes for constructing and analyzing models Interesting biological applications Explores classical models in ecology and evolution Questions at the end of every chapter Primers cover important mathematical topics Exercises with answers Appendixes summarize useful rules Labs and advanced material available
