Enabling Technologies for Very Large-Scale Synaptic Electronics Themis Prodromakis,Alexantrou Serb,2018-07-05 An important part of the colossal effort associated with the understanding of the brain involves using

electronics hardware technology in order to reproduce biological behavior in silico The idea revolves around leveraging decades of experience in the electronics industry as well as new biological findings that are employed towards reproducing key behaviors of fundamental elements of the brain notably neurons and synapses at far greater speed scale products than any software only implementation can achieve for the given level of modelling detail So far the field of neuromorphic engineering has proven itself as a major source of innovation towards the silicon brain goal with the methods employed by its community largely focused on circuit design analogue digital and mixed signal and standard commercial Complementary Metal Oxide Silicon CMOS technology as the preferred tools of choice when trying to simulate or emulate biological behavior However alongside the circuit oriented sector of the community there exists another community developing new electronic technologies with the express aim of creating advanced devices beyond the capabilities of CMOS that can intrinsically simulate neuron or synapse like behavior A notable example concerns nanoelectronic devices responding to well defined input signals by suitably changing their internal state weight thereby exhibiting synapse like plasticity This is in stark contrast to circuit oriented approaches where the synaptic weight variable has to be first stored typically as charge on a capacitor or digitally and then appropriately changed via complicated circuitry The shift of very much complexity from circuitry to devices could potentially be a major enabling factor for very large scale synaptic electronics particularly if the new devices can be operated at much lower power budgets than their corresponding traditional circuit replacements To bring this promise to fruition synergy between the well established practices of the circuit oriented approach and the vastness of possibilities opened by the advent of novel nanoelectronic devices with rich internal dynamics is absolutely essential and will create the opportunity for radical innovation in both fields The result of such synergy can be of potentially staggering impact to the progress of our efforts to both simulate the brain and ultimately understand it In this Research Topic we wish to provide an overview of what constitutes state of the art in terms of enabling technologies for very large scale synaptic electronics with particular stress on innovative nanoelectronic devices and circuit system design techniques that can facilitate the development of very large scale brain inspired electronic systems **Microtimes** ,1988
