Analysis Of Wilmers Et Al 2006:

Recovery of Gray Wolves in the Great Lakes Region of the United States Adrian P. Wydeven, Timothy R. van Deelen, Edward Heske, 2009-02-27 In this book we document and evaluate the recovery of gray wolves *Canis lupus* in the Great Lakes region of the United States The Great Lakes region is unique in that it was the only portion of the lower 48 states where wolves were never completely extirpated This region also contains the area where many of the first modern concepts of wolf conservation and research were developed Early proponents of wolf conservation such as Aldo Leopold Sigurd Olson and Durward Allen lived and worked in the region The longest ongoing research on wolf prey relations see Vucetich and Peterson Chap 3 and the first use of radio telemetry for studying wolves see Mech Chap 2 occurred in the Great Lakes region The Great Lakes region is the first place in the United States where Endangered wolf populations recovered All three states Minnesota Wisconsin and Michigan developed ecologically and socially sound wolf conservation plans and the federal government delisted the population of wolves in these states from the United States list of endangered and threatened species on March 12 2007 see Refsnider Chap 21 Wolf management reverted to the individual states at that time Although this delisting has since been challenged we believe that biological recovery of wolves has occurred and anticipate the delisting will be restored This will be the first case of wolf conservation reverting from the federal government to the state conservation agencies in the United States

Ecology of Climate Change Eric Post, 2013-08-11 Rising temperatures are affecting organisms in all of Earth's biomes but the complexity of ecological responses to climate change has hampered the development of a conceptually unified treatment of them In a remarkably comprehensive synthesis this book presents past ongoing and future ecological responses to climate change in the context of two simplifying hypotheses facilitation and interference arguing that biotic interactions may be the

primary driver of ecological responses to climate change across all levels of biological organization Eric Post's synthesis and analyses of ecological consequences of climate change extend from the Late Pleistocene to the present and through the next century of projected warming His investigation is grounded in classic themes of enduring interest in ecology but developed around novel conceptual and mathematical models of observed and predicted dynamics Using stability theory as a recurring theme Post argues that the magnitude of climatic variability may be just as important as the magnitude and direction of change in determining whether populations communities and species persist He urges a more refined consideration of species interactions emphasizing important distinctions between lateral and vertical interactions and their disparate roles in shaping responses of populations communities and ecosystems to climate change

Facing the Other: Novel Theories and Methods in Face Perception Research Davide Rivolta, Aina Puce, Mark A Williams, 2016-04-08 We rely heavily on faces during social interactions Humans possess the ability to recognise thousands of people very quickly and accurately without effort The serious social difficulties that follow abnormalities of the face recognition system i.e. prosopagnosia strongly underline the importance of typical face skills in our everyday life Over the last fifty years research on prosopagnosia along with research in the healthy population has provided insights into the cognitive and neural features behind typical face recognition This has also been achieved thanks to non invasive neuroimaging techniques such as functional Magnetic Resonance Imaging fMRI Electroencephalography EEG Magnetoencephalography MEG Diffusion Tensor Imaging DTI and Transcranial Magnetic Stimulation TMS However there is still much debate about the cognitive and neural mechanisms of face perception In the current Research Topic we plan to gather experimental works opinions commentaries mini reviews and reviews that focus on new or novel theories and methods in face perception research Where is the field at the moment Do we need to re think the experimental procedures we have adopted so far Again what kind of techniques or combination of them and analysis methods will be important in the future From the experimental point of view we encourage both behavioural and neuroimaging contributions e.g. fMRI EEG MEG DTI and TMS Despite the main emphasis on face perception memory and identification we will also consider original works that focus on other aspects of face processing such as expression recognition attractiveness judgments and face imagery In addition animal investigations and experimental manipulations that alter face recognition abilities in typical human subjects e.g. hypnosis are also welcome Overall we are proposing a Research Topic that looks at face processing using different perspectives and welcome contributions from different domains such as psychology neurology neuroscience cognitive science and philosophy The current Research Topic evolved over the desire to acknowledge the relatively recent loss of three giants in the field Drs Shlomo Bentin Truett Allison and Andy Calder We dedicate this Research Topic to them and their pioneering studies

volume provides a comprehensive exploration of stroke from basic mechanisms of disease to enhanced diagnostic and therapeutic capabilities. The ongoing efforts within the neurological community are also highlighted, bringing a better understanding of the pathophysiological basis of this disorder. Clinicians will find invaluable information that can be used to enhance the lives of an aging global population. Covered topics include the functional anatomy of the brain itself as well as advancements in the understanding of the biochemical background of strokes. Related fields and their dramatic impact on stroke research are also included, with findings in the fields of epidemiology, genetics, neuroimaging, and interventional radiology thoroughly explored. In addition, great attention is paid to therapeutic avenues including investigation, prevention, and patient management.

Principles and Practice of Geriatric Surgery Ronnie Ann Rosenthal, Michael E.

Zenilman, Mark R. Katlic, 2011-07-12 In the preface to this impressive and well produced book the editors state that their aim is not to describe a new surgical specialty since most surgeons will soon need to be geriatric surgeons but to assemble a comprehensive account that will allow all providers of healthcare to the elderly to understand the issues involved in choosing surgery as a treatment option for their patients. This is a useful book that deserves to do well. I hope that the editors and their publisher will have the stamina to make this the first of several editions as it is clear that updated information about surgery in the elderly will be required to keep pace with this important field. Theory of Wildlife Population

Ecology Bruce D. Leopold, 2018-10-25 Understanding wildlife population ecology is vital for all wildlife managers and conservation biologists. Leopold draws on 30 years of research and teaching experience to give students and natural resource professionals the foundation they need to effectively manage wildlife populations. He begins with the key statistical concepts and research approaches necessary to gain insight into various models of population dynamics. The many factors that influence wildlife populations are thoroughly explored and their consequences are investigated. In addition, the author presents techniques for analyzing wildlife harvest data and a lucid discussion of valuable wildlife census methods. Frequent examples of foundational literature supplement each chapter with applications of the theories and provide a concise compendium of fundamental concepts of population ecology. Abundant statistical exercises reinforce students' learning throughout the text.

Feeding Ecology of and Lead Exposure in a Top Predator Mirjam Nadjafzadeh, 2011 Although the feeding ecology of raptors has attracted the attention of many scientists, aspects such as diet selection and foraging strategy are still poorly understood. This

is particularly true for large species such as the white tailed eagle Representative assessments of the contribution of food sources containing toxins such as lead to raptor diets are scarce but are essential for optimising conservation efforts This dissertation investigated the feeding ecology of white tailed eagles to shed light on the interaction of such top predators with their environment and to improve the conservation management of this lead exposed species A use of complementary methods identified the most effective approach for dietary investigations on free ranging raptors The findings revealed that the foraging strategy of white tailed eagles is influenced by both individual and environmental factors and corresponds to an efficient food intake in terms of optimal foraging theory The main sources of lead fragments that induce fatal lead poisoning are shot mammalian carcasses which constitute important alternative diet components for white tailed eagles during the hunting season One approach to solve the lead poisoning problem can be the use of lead free bullets by hunters that fragment into sufficiently large particles which would be avoided by scavenging eagles and birds with similar feeding behaviour

American Megafaunal Extinctions at the End of the Pleistocene Gary Haynes, 2008-12-23 The volume contains summaries of facts theories and unsolved problems pertaining to the unexplained extinction of dozens of genera of mostly large terrestrial mammals which occurred ca 13 000 calendar years ago in North America and about 1 000 years later in South America Another equally mysterious wave of extinctions affected large Caribbean islands around 5 000 years ago The coupling of these extinctions with the earliest appearance of human beings has led to the suggestion that foraging humans are to blame although major climatic shifts were also taking place in the Americas during some of the extinctions The last published volume with similar but not identical themes Extinctions in Near Time appeared in 1999 since then a great deal of innovative exciting new research has been done but has not yet been compiled and summarized Different chapters in this volume provide in depth resum s of the chronology of the extinctions in North and South America the possible insights into animal ecology provided by studies of stable isotopes and anatomical physiological characteristics such as growth increments in mammoth and mastodont tusks the clues from taphonomic research about large mammal biology the applications of dating methods to the extinctions debate and archeological controversies concerning human hunting of large mammals
