Trachea and Alveoli (Lungs)
The trachea and alveoli are the main parts of the respiratory system. The trachea (windpipe) is the main airway that carries air in and out of the lungs. The alveoli are small air sacs where oxygen and carbon dioxide are exchanged. The trachea is made up of cartilage rings and is located in the front of the neck. The alveoli are located in the back of the chest and are surrounded by a network of blood vessels. The trachea is about 10 cm long and 2.5 cm in diameter. The alveoli are about 0.5 mm in diameter and are located in the lungs.

BREATHE IN ... BREATHE OUT

The mechanism of respiration involves the contraction and relaxation of the diaphragm and the external intercostal muscles. This is dependent on the pressure changes in the thoracic cavity and the external environment.

Mechanism of Respiration

- Inhalation - The diaphragm contracts and moves down, and the external intercostal muscles contract and pull the rib cage up and out.
- Exhalation - The diaphragm relaxes and moves up, and the external intercostal muscles relax.
- Inhalation - The diaphragm contracts and moves down, and the external intercostal muscles contract and pull the rib cage up and out.
- Exhalation - The diaphragm relaxes and moves up, and the external intercostal muscles relax.

Inhalation - The diaphragm contracts and moves down, and the external intercostal muscles contract and pull the rib cage up and out. This creates a negative pressure in the thoracic cavity, which causes air to be drawn in. **Exhalation** - The diaphragm relaxes and moves up, and the external intercostal muscles relax. This creates a positive pressure in the thoracic cavity, which causes air to be pushed out.

Factors affecting respiration

- Temperature** - A rise in temperature increases the rate of respiration.
- Concentration of oxygen** - A higher concentration of oxygen increases the rate of respiration.
- Concentration of carbon dioxide** - A higher concentration of carbon dioxide increases the rate of respiration.
- pH** - A lower pH (more acidic) increases the rate of respiration.
- Enzymes** - Enzymes are involved in the chemical reactions of respiration.
- Water** - Water is a reactant in the chemical reactions of respiration.

Lung Volumes

- Tidal Volume** - The volume of air that is inhaled and exhaled during normal breathing.
- Inspiratory Volume** - The volume of air that is inhaled during a normal inspiration.
- Expiratory Volume** - The volume of air that is exhaled during a normal expiration.
- Residual Volume** - The volume of air that remains in the lungs after a normal expiration.
- Vital Capacity** - The maximum volume of air that can be inhaled and exhaled during a maximal inspiration and expiration.

Respiratory Volumes

- Inspired Volume** - The volume of air that is inhaled during a normal inspiration.
- Expired Volume** - The volume of air that is exhaled during a normal expiration.
- Residual Volume** - The volume of air that remains in the lungs after a normal expiration.
- Vital Capacity** - The maximum volume of air that can be inhaled and exhaled during a maximal inspiration and expiration.
