The Perceptual Structure of Sound Dik J. Hermes, 2023-06-10 This book presents a comprehensive review of how acoustic waves are processed by the auditory system into structured sounds such as musical melodies speech utterances or environmental sounds After an introduction an overview is given of how the ears distribute acoustic information over a large array of frequency channels that contain the auditory information used by the central nervous system to generate a mental image of what is happening around the listener This process called auditory scene analysis consists of two stages In the first stage auditory units are formed such as musical tones and speech syllables Each auditory unit is perceived at a well defined moment in time the beat location of that auditory unit Moreover from this process of auditory unit formation the auditory attributes of these auditory units emerge such as their timbre their pitch their loudness and their perceived location Each of these attributes is discussed in the corresponding chapter In the second stage

of auditory scene analysis auditory stream formation the successive auditory units are integrated into auditory streams i.e. temporally structured sequences of auditory units that are perceived as emanating from one and the same sound source Examples of such auditory streams are musical melodies and the utterances of one speaker The temporal structure of an auditory stream its rhythm is determined by the beat locations of its auditory units The role played by the auditory attributes of the consecutive auditory units is discussed The melodies of musical streams and the intonation contours of spoken utterances emerge from this process In music the beats of parallel streams generally fit into a metric pattern and depending on harmony simultaneous tones can be perceived as consonant or dissonant Finally the book contains many sound examples including the MATLAB scripts with which they are generated

Cochlear Mechanisms: Structure, Function, and Models

J. Wilson,2012-12-06 Great advances have been made in understanding hearing in recent years In particular the mechanical function of the cochlea has become the focus of intense interest This started in one direction with the discovery of otoacoustic emissions in 1978 which required active mechanical amplification processes as first postulated by Gold in 1948 Direct evidence for the role of this mechanism in sharpening up the otherwise poor basilar membrane tuning properties was provided in 1982 and in 1983 motility was shown in outer hair cells In parallel an immense amount of work has been done on the electrophysiology of hair cells following the first intracellular recordings in 1977 Over a longer time scale models of basilar membrane motion have been developed and refined and recently much effort has been put into incorporating active mechanisms and non linear processes It seemed an opportune time to bring together the leading workers in these various areas to take stock of the whole field and to stimulate further progress This book represents the proceedings of a NATO ARW on the Mechanics of Hearing held at the University of Keele 3 8 July 1988 The conception of the meeting owes much to earlier meetings held in Boston in 1985 Peripheral Auditory Mechanisms Eds J B Allen J L Assistive Technology for the Hearing-impaired, Deaf and Deafblind Marion A. Hersh,Michael A Johnson,2006-04-28 Affirmative legislative action in many

countries now requires that public spaces and services be made accessible to disabled people Although this is often interpreted as access for people with mobility impairments such legislation also covers those who are hearing or vision impaired In these cases it is often the provision of advanced technological devices and aids which enables people with sensory impairments to enjoy the theatre cinema or a public meeting to the full Assistive Technology for the Hearing impaired Deaf and Deafblind shows the student of rehabilitation technology how this growing technical provision can be used to support those with varying reductions in auditory ability and the deafblind in modern society Features instruction in the physiology of the ear together with methods of measurement of hearing levels and loss the principles of electrical engineering used in assistive technology for the hearing impaired description and demonstration of electrical engineering used in hearing aids and other communications enhancement technologies explanation of many devices designed for every day living in terms of generic electrical engineering sections of practical projects and investigations which will give the reader ideas for student work and for self teaching The contributors are internationally recognised experts from the fields of audiology electrical engineering signal processing telephony and assistive technology Their combined expertise makes Assistive Technology for the Hearing impaired Deaf and Deafblind an excellent text for advanced students in assistive and rehabilitation technology and to professional engineers and medics working in assistive technology who wish to maintain an up to date knowledge of current engineering advances **Human Biology** Daniel D.
