The Parts of Lungs

The respiratory system is made up of

- Trachea
- Bronchi (Trachea)
- Lung (Lung)
- Alveoli (Alveoli)
- Capillaries (Capillaries)
- Diaphragm (Diaphragm)
- Intercostal muscles (Intercostal muscles)
- Diaphragm

Right and Left Lungs

Our respiratory system is the main part which air enters the body. The right (anterior) side, the left (posterior) side.

The main cavity is made up of two parts - the right and left lung cavities.

Right lung - the right lung is larger and contains the right ventricle of the heart.

Left lung - the left lung is smaller and contains the left ventricle of the heart.

Diaphragm - the diaphragm is a muscular partition between the chest and abdominal cavities.

Intercostal muscles - the intercostal muscles are located between the ribs and help to expand the chest cavity.

Trachea - the trachea is the windpipe and carries air into the lungs.

Bronchi - the bronchi are the main airways that branch out from the trachea into the lungs.

Alveoli - the alveoli are small air sacs where gas exchange takes place.

Capillaries - the capillaries are small blood vessels that surround the alveoli.

Diaphragm - the diaphragm is a muscular partition between the chest and abdominal cavities.

Intercostal muscles - the intercostal muscles are located between the ribs and help to expand the chest cavity.

Bronchi - the bronchi are the main airways that branch out from the trachea into the lungs.

Alveoli - the alveoli are small air sacs where gas exchange takes place.

The Bronchus

The bronchus is the main airway that carries air into the lungs. It is made up of two parts - the right and left bronchi.

The right bronchus is larger and contains the right ventricle of the heart. The left bronchus is smaller and contains the left ventricle of the heart.

The mechanism of respiration involves the contraction and relaxation of the diaphragm and the intercostal muscles. This is dependent on the pressure changes in the thoracic cavity.

Inhalation: The diaphragm contracts and moves down, and the intercostal muscles contract. This increases the volume of the thoracic cavity, and the pressure inside decreases, causing air to enter the lungs.

Exhalation: The diaphragm relaxes and moves up, and the intercostal muscles relax. This decreases the volume of the thoracic cavity, and the pressure inside increases, causing air to leave the lungs.

Respiration: The process of gas exchange between the lungs and the blood. It involves the diffusion of oxygen from the lungs into the blood, and the diffusion of carbon dioxide from the blood into the lungs.

Gas exchange: The process of exchanging gases between the lungs and the blood. It involves the diffusion of oxygen from the lungs into the blood, and the diffusion of carbon dioxide from the blood into the lungs.

Diffusion: The process of molecules moving from an area of high concentration to an area of low concentration. It is the main mechanism of gas exchange in the lungs.

Osmosis: The process of water moving from an area of high concentration to an area of low concentration through a semi-permeable membrane. It is not involved in gas exchange.

Active transport: The process of moving molecules from an area of low concentration to an area of high concentration using energy. It is not involved in gas exchange.

Passive transport: The process of moving molecules from an area of high concentration to an area of low concentration without using energy. It is the main mechanism of gas exchange in the lungs.

Facilitated diffusion: The process of moving molecules from an area of high concentration to an area of low concentration through a protein channel. It is not involved in gas exchange.

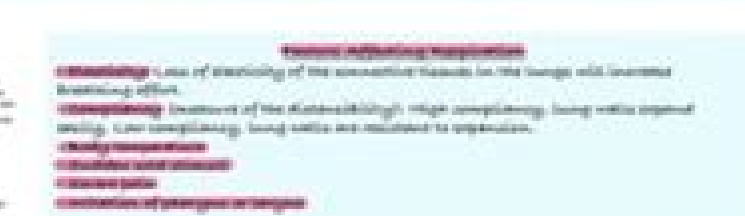

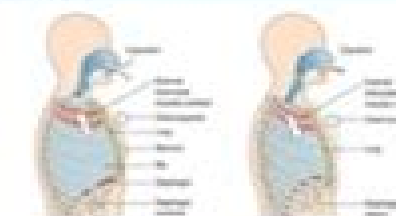

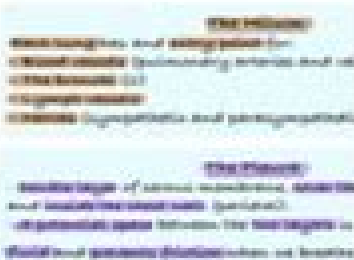

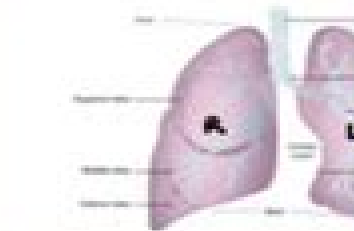

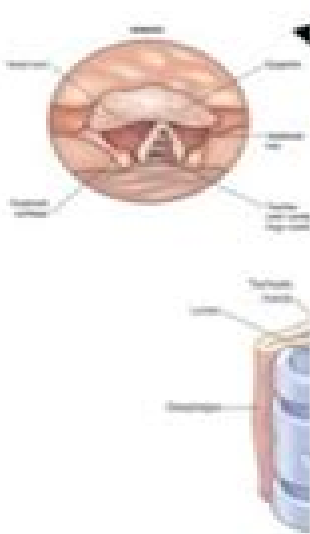

Endocytosis: The process of taking molecules into the cell by engulfing them. It is not involved in gas exchange.

Exocytosis: The process of releasing molecules from the cell by fusing a vesicle with the cell membrane. It is not involved in gas exchange.

Phagocytosis: The process of taking large particles into the cell by engulfing them. It is not involved in gas exchange.

Pinocytosis: The process of taking small molecules into the cell by engulfing them. It is not involved in gas exchange.

Osmosis: The process of water moving from an area of high concentration to an area of low concentration through a semi-permeable membrane. It is not involved in gas exchange.

Respiratory system: The system of organs and tissues that are involved in the process of respiration. It includes the trachea, bronchi, lungs, and diaphragm.
