illustrated by concrete examples Computer aided symbolic circuit analysis is useful in analog integrated circuit design Analytic expressions for the network transfer functions contain information that is not provided by a numerical simulation result However these expressions are generally extremely long and difficult to interpret therefore it is necessary to be able to approximate them guided by the magnitude of the individual circuit parameters Engineering has been described as the art of making approximations The inclusion of symbolic analysis in analog circuit design reduces the implied risk of ambiguity during the approximation process A systematic method based on the nullor concept is used to obtain the basic feedback transistor amplifier configurations Approximate expressions for the locations of poles and zeros for linear networks are obtained using the extended pole splitting technique An unusual feature in Symbolic Analysis in Analog Integrated Circuit Design is the consistent use of the transadmittance element with finite linear or nonlinear or infinite i e nullor gain as the only requisite circuit element The describing function method is used to obtain approximate symbolic expressions for the harmonic distortion generated by a soft or hard transconductance nonlinearity embedded in an arbitrary linear network The design and implementation of a program i e CASCA for symbolic analysis of time continuous networks is described The algorithms can also be used to solve other linear problems e g the analysis of time discrete switched capacitor networks Symbolic Analysis in Analog Integrated Circuit Design serves as an excellent resource for students and researchers as well as for industry designers who want to familiarize themselves with circuit analysis This book may also be used for advanced courses on the subject

Analog Circuit Design Johan Huijsing, Rudy J. van der Plassche, Willy M.C. Sansen, 2013-04-17 Many interesting design trends are shown by the six papers on operational amplifiers Op Amps Firstly there is the line of stand alone Op Amps using a bipolar IC technology which combines high frequency and high voltage This line is represented in papers by Bill Gross and Derek Bowers Bill Gross shows an improved high frequency compensation technique of a high quality three stage Op Amp Derek Bowers improves the gain and frequency behaviour of the stages of a two stage Op Amp Both papers also present trends in current mode feedback Op Amps Low voltage bipolar Op Amp design is presented by Ieroen Fonderie He shows how multipath nested Miller compensation can be applied to turn rail to rail input and output stages into high quality low voltage Op Amps Two papers on CMOS Op Amps by Michael Steyaert and Klaas Bult show how high speed and high gain VLSI building blocks can be realised Without departing from a single stage OTA structure with a folded cascode output a thorough high frequency design technique and a gain boosting technique contributed to the high speed and the high gain achieved with these Op Amps Finally Rinaldo Castello shows us how to provide output power with CMOS buffer amplifiers The combination of class A and AB stages in a multipath nested Miller structure provides the required linearity and bandwidth
