

C. Return to the following pedigree for questions 12 – 16.

12. The pedigree above shows a family's pedigree for colorblindness. Which row contains the numbers of colorblindness and not have it? From the pedigree above, it can be seen that only the females are carriers for colorblindness
13. Based on your answer to question 12, what kind of trait is colorblindness? Sex linked, recessive. Sex Y linked recessive disorder. Two recessive alleles are needed to cause disease in females and one recessive allele is enough to cause disease in males. This is because males have XY and females have XX. If there is female has one dominant and one recessive allele then she will be a carrier for the disease or disorder.
14. Why does individual IV-7 have colorblindness? The father of IV-7 is colorblind and her mother is a carrier. Therefore she received one allele from both parents.
15. Why do all the daughters in generation II carry the colorblind gene? They all carry the colorblind gene because their father is colorblind, thus they all received the recessive allele from him.
16. Identify or name the colorblind males in generations IV. The colorblind males in generations IV are IV-1 and IV-5.
