50 In Water Planet:

Exoplanets Sara Seager, 2011-01-15 For the first time in human history we know for certain the existence of planets around other stars Now the fastest growing field in space science the time is right for this fundamental source book on the topic which will lay the foundation for its continued growth Exoplanets serves as both an introduction for the non specialist and a foundation for the techniques and equations used in exoplanet observation by those dedicated to the field **The Solar System 1** Therese Encrenaz, James Lequeux, 2021-12-29 This book presents a global and synthetic vision of planetology the study of objects in the Solar System In the past several decades planetology has undergone a real revolution marked in particular by the discovery of the Kuiper belt beyond Neptune the discovery of extrasolar planets and also by the space exploration of ever more distant objects Today it is at the crossroads of many disciplines astronomy geophysics geochemistry and biology The Solar System 1 deals with the Solar System as a whole offering a general presentation of the objects that compose it and its place in the galaxy It also deals with planetary systems exoplanets and the interaction of Solar System objects with interplanetary medium Finally it analyzes the telluric and giant planets Protostars and Planets VI Henrik Beuther, Ralf S. Klessen, Cornelis Petrus Dullemond, Thomas K. Henning, 2014-12-18 Proceedings of a conference held in Heidelberg Germany July 15 20 2013 *Comparative Climatology of Terrestrial Planets* Stephen J. Mackwell, Amy A. Simon-Miller, Jerald W. Harder, Mark A. Bullock, 2014-01-25 The early development of life a fundamental question for humankind requires the presence of a suitable planetary climate Our understanding of how habitable planets come to be begins with the worlds closest to home Venus Earth and Mars differ only modestly in their mass and distance from the Sun yet their current climates could scarcely be more divergent Only Earth has abundant liquid water Venus has a runaway greenhouse and evidence for life supporting conditions on Mars points to a bygone era In addition an Earth like hydrologic cycle has been revealed in a surprising place Saturn s cloud covered satellite Titan has liquid hydrocarbon rain lakes and river networks Deducing the initial conditions for these diverse worlds and unraveling how and why they diverged to their current climates is a challenge at the forefront of planetary science Through the contributions of more than sixty leading experts in the field *Comparative Climatology of Terrestrial Planets* sets forth the foundations for this emerging new science and brings the reader to the forefront of our current understanding of atmospheric formation and climate evolution Particular emphasis is given to surface atmosphere interactions evolving stellar flux mantle processes photochemistry and interactions with the interplanetary environment all of which influence the climatology of terrestrial planets From this cornerstone both current professionals and most especially new students are brought to the threshold enabling the next generation of new advances in our own solar system and beyond Contents Part I Foundations Jim Hansen Mark Bullock Scot Rafkin Caitlin Griffith Shawn Domagal Goldman and Antígona Segura Kevin Zahnle Part II The Greenhouse Effect and Atmospheric Dynamics Curt Covey G Schubert and J Mitchell Tim Dowling Francois Forget and Sebastien Lebonnois Vladimir

Kieffer,1992-10 The planet Mars has been a subject of wonder for millennia as attested by its place in mythology by later speculation about its canals and by the scientific and public excitement over the Viking mission Although the scientific literature about the planet is voluminous no comprehensive treatment of the results of modern spacecraft exploration has yet been made available This volume fills that gap by providing a summary of what is presently known about Mars and identifying many puzzles such as polar cap variance occurrence of dust storms and the possible location of water The introductory chapter cites questions controversies and milestones in the study of Mars and also includes an annotated book list basic data about the planet and a guide to Martian seasons A chapter on telescopic observation credits the contributions made by many amateurs that have advanced our knowledge of variations observed on Mars A chapter on spacecraft exploration by an American and a Russian author who have participated in all Mars missions includes a revelation of an additional Soviet attempt Twenty nine technical articles cover geophysics bedrock geology surface atmosphere exosphere and magnetic field and climate history Two chapters address the search for life on Mars three concluding chapters consider the Martian satellites An indispensable reference for scientists Mars will also serve as a complete sourcebook for serious amateur astronomers

Exoplanets: Compositions, Mineralogy, Evolution Natalie R. Hinkel,Keith D. Putirka,Siyi Xu,2024-09-02 The focus for RiMG volume 90 is on rocky exoplanets because the search for truly Earth like planets is of special interest The goal is to motivate communication between the disciplines so as to make the best use possible of existing data and data yet to be collected by the James Webb and the Nancy Grace Roman Space Telescopes since the astronomy community is gathering data on stars and exoplanets at an accelerating rate Such data now include exoplanet size and mass i e density as well as their atmospheric compositions which are collectively telltale of mineralogy and evolution Much of what is published may still fall in the realm of educated speculation but our conjectures are metamorphosing into testable hypotheses There is now a remarkably large amount of astronomical data with even more on the way that geochemists and petrologists can make much use of But just as astronomers may benefit from geologic insights geologists need our colleagues in astronomy to help interpret their data and their underlying implications to better understand its astronomical context Our hopes for this volume will be fulfilled if readers initiate their own analyses of what at present may seem like novel or unusual data and if new collaborations between academic departments and subfields are forged

Dick, National Aeronautics and Space Administration, 2010-07-07 On 29 July 1958 President Dwight D Eisenhower signed the National Aeronautics and Space Act creating the National Aeronautics and Space Administration NASA which became operational on 1 October of that year Over the next 50 years NASA achieved a set of spectacular feats ranging from advancing the well established field of aeronautics to pioneering the new fields of Earth and space science and human spaceflight In the midst of the geopolitical context of the Cold War 12 Americans walked on the Moon arriving in peace for all mankind Humans saw their home planet from a new perspective with unforgettable Apollo images of Earthrise and the Blue Marble as well as the pale blue dot from the edge of the solar system A flotilla of spacecraft has studied Earth while other spacecraft have probed the depths of the solar system and the universe beyond In the 1980s the evolution of aeronautics gave us the first winged human spacecraft the Space Shuttle and the International Space Station stands as a symbol of human cooperation in space as well as a possible way station to the stars With the Apollo fire and two Space Shuttle accidents NASA has also seen the depths of tragedy In this volume a wide array of scholars turn a critical eye toward NASA's first 50 years probing an institution widely seen as the premier agency for exploration in the world carrying on a long tradition of exploration by the United States and the human species in general Fifty years after its founding NASA finds itself at a crossroads that historical perspectives can only help to illuminate

What's Hidden Inside Planets? Sabine Stanley, 2023-11-14 A guided journey through the inner workings of Earth the cloaked mysteries of other planets in our solar system and beyond Extreme heat Extreme cold Extreme pressure Toxic gases Scorching magma flows and ice volcanoes Interior tides Asteroids filled with gold In *What's Hidden Inside Planets* planetary scientist Dr Sabine Stanley cracks the surface to reveal the beating heart of planets and what created them from the building blocks of swirling cosmic dust pebbles and gas to coalesced planetesimal beginnings to the worlds we see today We're only beginning to explore the secretive interiors of planets where awe inspiring wonders await Our home planet is no exception Earth from space looks like a shimmering gem suspended in an inky infinite expanse But this serene image masks the magnificent and volatile interior forces that make life possible for millions of species on the surface The placid appearances of our neighboring planets belie their powers and science fiction worthy features like diamond rain The daily machinations of Earth's deep interior make the planet a habitable yet sometimes treacherous place to live Drill down thousands of miles through our built environments and soil sand water rock and minerals to the outer mainly liquid iron with nickel and inner core encountering intense convection roiling metals hidden continents and shifting tectonic plates Discover the effects of magnetism rotation and seismic activity seen and sensed in the forms of auroras hurricanes volcanoes and earthquakes among other manifestations Our neighboring planets boast their own fierce forces along with moons covered by

frozen oceans that might someday reveal extraterrestrial life Join this exciting journey to far flung interstellar locations and the center of the Earth to learn what lies beneath our feet and why it is the best real estate in our solar system *The Twin Sister Planets Venus and Earth* Robert J. Malcuit, 2014-11-25 This book explains how it came to be that Venus and Earth while very similar in chemical composition zonation size and heliocentric distance from the Sun are very different in surface environmental conditions It is argued here that these differences can be accounted for by planetoid capture processes and the subsequent evolution of the planet satellite system Venus captured a one half moon mass planetoid early in its history in the retrograde direction and underwent its fatal attraction scenario with its satellite Adonis Earth on the other hand captured a moon mass planetoid Luna early in its history in prograde orbit and underwent a benign estrangement scenario with its captured satellite

The Earth as a Distant Planet M. Vázquez, E. Pallé, P. Montañés Rodríguez, 2010-03-12 In *The Earth as a Distant Planet* the authors become external observers of our solar system from a distance and try to determine how one can understand how Earth the third in distance to the central star is essentially unique and capable of sustaining life The knowledge gained from this original perspective is then applied to the search for other planets outside the solar system or exoplanets Since the discovery in 1992 of the first exoplanet the number of planet detections has increased exponentially and ambitious missions are already being planned for the future The exploration of Earth and the rest of the rocky planets are Rosetta stones in classifying and understanding the multiplicity of planetary systems that exist in our galaxy In time statistics on the formation and evolution of exoplanets will be available and will provide vital information for solving some of the unanswered questions about the formation as well as evolution of our own world and solar system Special attention is paid to the biosignatures signs of life detectable in the Earth's reflected spectra and the search for life in the universe The authors are experts on the subject of extrasolar planets They provide an introductory but also very much up to date text making this book suitable for researchers and for advanced students in astronomy and astrophysics

Geology and Habitability of Terrestrial Planets

Kathryn E. Fishbaugh, Phillipe Lognonné, François Raulin, David J. Des Marais, Oleg Korablev, 2007-09-07 Given the fundamental importance of and universal interest in whether extraterrestrial life has developed or could eventually develop in our solar system and beyond it is vital that an examination of planetary habitability go beyond simple assumptions such as Where there is water there is life This book has resulted from a workshop at the International Space Science Institute ISSI in Bern Switzerland which brought together planetary geologists geophysicists atmospheric scientists and biologists to discuss the multi faceted problem of how the habitability of a planet co evolves with the geology of the surface and interior the atmosphere and the magnetosphere Each of the six chapters have been written by authors with a range of expertise so that each chapter is itself multi disciplinary comprehensive and accessible to scientists in all disciplines These chapters delve into what life needs to exist and ultimately to thrive the early environments of the young terrestrial planets the role of volatiles in habitability currently habitable but possibly not inhabited geologic environments the connection between a planet s inner workings and the habitability of its surface and the effects on planetary atmospheres of solar evolution and the presence or absence of a magnetosphere This book serves as an ideal reference for those planning missions that will hunt for biomarkers especially on Mars for biologists and geoscientists seeking the other side of the story and for researchers and upper level students interested in an in depth review of the geologic evolution of terrestrial planets from their cores to their magnetospheres and how that evolution shapes the habitability of the planetary surface

Planets of the Known Galaxy

Kevin J. E. Walsh, 2024-11-15 This book offers a tour of the known galaxy here defined as the region of interstellar space closest to Earth The phrase the known galaxy has a particular resonance in science fiction as it refers to the part of the Milky Way that from the perspective of a point in time centuries from now may have been explored and settled by human beings In the known galaxy there are gloomy ocean worlds illuminated by the light of exploding stars There are worlds where precious

gems could be as common as pebbles There are planets eternally wandering between the stars like the Flying Dutchman There are lava worlds steam worlds hot Jupiters cold Jupiters and maybe even worlds like our Earth The purpose of the book is to begin to give this region a sense of place in the same way that Mars is now starting to be appreciated as a location rather than just a planet In doing so the book merges our current scientific knowledge of the known galaxy with speculative fiction and with older legends and myths A sense of place is the feeling that some locations have a special meaning This emotional connection arises from a combination of cultural and environmental factors that make individuals care about a particular place It is challenging to create a sense of place for distant locations that no human has visited and for which our current knowledge is limited This book attempts to take a step in this direction by dividing the known galaxy into a number of clearly described distinct regions by providing scientific descriptions of the likely environmental conditions on the known planets of these regions and by linking these planets to their literary and mythological context The book is aimed at fans of both science fact and science fiction It combines a tour of real planets outside of our solar system with tales of their fictional counterparts The combination of solid scientific facts and analysis with speculation and imagination will be appealing to readers who want to gain a feeling for these planets as places with a back story rather than just as names somewhere out there in the sky

Earth Central Debbie Keiser, 2007-07 What's inside Earth Why do we have earthquakes What causes the ocean tides These questions and many others are examined as students study Earth from the inside out Students also become geologists as they consider plate tectonics earthquakes volcanoes and their causes They become oceanographers and meteorologists to gain a better understanding of elements affecting the surface of our world through a study of weather patterns and tides and currents in the ocean Your students will come to appreciate the atmosphere that makes life on Earth possible as they learn about our planet's position in the solar system After *Earth Central* students will have a deeper love and understanding of their planet

Longman School Atlas (Revised Edition), *Weather and Climate on Planets* K Y Kondratyev, G E Hunt, 2013-10-22 *Weather and Climate on Planets* discusses the problems of the meteorology of planets Planetary meteorology is the study of the regularities of the atmospheres and their thermal regime and dynamics specifically the properties of the planetary surfaces and the specific features of the interactions between the atmospheres and surfaces This book contains four chapters and begins with an overview of origin and evolution of the solar system and planetary atmospheres The introductory chapter describes some basic characteristics of planetary atmospheres laboratory and numerical modeling of the atmospheric circulation and the application of remote sounding The remaining three chapters examine the weather climate and other meteorological aspects of planet Venus Mars and Jupiter This book will be of value to meteorologists astronomers researchers and students

Exploring Venus as a Terrestrial Planet Larry W. Esposito, Ellen R. Stofan, Thomas E. Cravens, 2013-05-28 Published by the American Geophysical Union as part of the Geophysical Monograph Series Volume 176 With the search for extra solar planets in full gear it has become essential to gain a more detailed

understanding of the evolution of the other earth like planets in our own solar system Space missions to Venus including the Soviet Veneras Pioneer Venus and Magellan provided a wealth of information about this planet enigmatic surface and atmosphere but left many fundamental questions about its origin and evolution unanswered This book discusses how the study of Venus will aid our understanding of terrestrial and extra solar planet evolution with particular reference to surface and interior processes atmospheric circulation chemistry and aeronomy Incorporating results from the recent European Venus Express mission Exploring Venus as a Terrestrial Planet examines the open questions and relates them to Earth and other terrestrial planets The goal is to stimulate thinking about those broader issues as the new Venus data arrive
