Statistical Models and Methods for Financial Markets Tze Leung Lai, Haipeng Xing, 2008-07-25 The idea of writing this book arose in 2000 when the first author was assigned to teach the required course STATS 240 Statistical Methods in Finance in the new M.S. program in financial mathematics at Stanford which is an interdisciplinary program that aims to provide a master's level education in applied mathematics, statistics, computing, finance and economics. Students in the program had different backgrounds in statistics. Some had only taken a basic course in statistical inference while others had taken a broad spectrum of M.S. and Ph.D. level statistics courses. On the other hand, all of them had already taken required core courses in investment theory and derivative pricing and STATS 240 was supposed to link the theory and pricing formulas to real world data and pricing or investment strategies. Besides students in the program, the course also attracted many students from other departments in the university further increasing the heterogeneity of students as many of them had a strong background in mathematical and statistical modeling from the mathematical, physical and engineering sciences but no previous experience in finance. To address the diversity in background but common strong interest in the subject and in a potential career as a quant in the financial industry, the course material was carefully chosen not only to present basic statistical methods of importance to quantitative finance but also to summarize domain knowledge in finance and show how it can be combined with statistical modeling in financial analysis and decision making. The course material evolved over the years especially after the second author helped as the head TA during the years 2004 and 2005.

Econometric Analysis Sharif Hossain, 2024-02-08 For the last four decades the uses of econometric tools and techniques irrespective of discipline have been increasing rapidly for solving problems appropriate decision making and policy formulation. Generally it is accepted that the study of modern business and economics is incomplete without a proper knowledge of econometric tools and techniques. In view of the increasing complexity and variety of problems in business and economics, students and researchers may not be able to cope and hence may remain unfamiliar with many aspects of business and economic problems. Thus this book was written to explore basic and advanced studies of econometrics for undergraduate and graduate students of business and economics as well as for researchers already engaged in these fields who require an introduction to econometric methods and their application for solving of real life problems. The book offers a balanced presentation of fundamental and advanced levels of econometric concepts and methods along with practical examples of their effective application in real life problems.
