

Graphing and Analyzing Scientific Data

Graphing is an important procedure used by scientist to display the data that is collected during a controlled experiment. There are three main types of graphs:

Pie/circle graphs: Used to show parts of a whole.

Bar graphs: Used to compare amounts.

Line graphs: Use to show the change of one piece of information as it relates to another change.

Both bar and line graphs have an "X" axis (horizontal) and a "Y" axis (vertical).

Parts of a Graph:

Title: Summarizes information being represented in ANY graph.

Independent Variable: The variable that is controlled by the experimenter, such as, time, dates, depth, and temperature. This is placed on the X axis.

Dependent Variable: The variable that is directly affected by the I.V. It is the result of what happens as time, dates, depth and temperature are changed. This is placed on the Y axis.

Scales for each Variable: In constructing a graph, one needs to know where to plot the points representing the data. In order to do this a scale must be employed to include all the data points.

A. Graph the following information in a **BAR** graph. Label and number the x and y-axis appropriately.

Data Analysis with Open Source Tools

Philipp K. Janert, 2010-11-11 Collecting data is relatively easy but turning raw information into something useful requires that you know how to extract precisely what you need. With this insightful book, intermediate to experienced programmers interested in data analysis will learn techniques for working with data in a business environment. You'll learn how to look at data to discover what it contains, how to capture those ideas in conceptual models, and then feed your understanding back into the organization through business plans, metrics, dashboards, and other applications. Along the way, you'll experiment with concepts through hands-on workshops at the end of each chapter. Above all, you'll learn how to think about the results you want to achieve rather than rely on tools to think for you. Use graphics to describe data with one, two, or dozens of variables. Develop conceptual models using back-of-the-envelope calculations as well as scaling and probability arguments. Mine data with computationally intensive methods such as simulation and clustering. Make your conclusions understandable through reports, dashboards, and other metrics programs. Understand financial calculations including the time value of money. Use dimensionality reduction techniques or predictive analytics to conquer challenging data analysis situations. Become familiar with different open-source programming environments for data analysis. Finally, a concise reference for understanding how to conquer piles of data. Austin King, Senior Web Developer, Mozilla. An indispensable text for aspiring data scientists. Michael E. Driscoll, CEO, Founder, Dataspora.
