

THE SKELETON
The skeleton is the framework of the body, supporting the soft organs and protecting them. It is composed of bones and cartilage. The bones are made of a hard, white, mineralized substance called bone tissue. The cartilage is a soft, white, fibrous substance. The skeleton is divided into the axial skeleton (skull, spine, rib cage) and the appendicular skeleton (arms and legs).

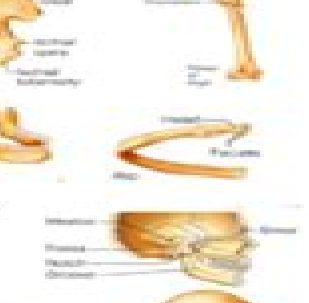

THE MUSCLES
The muscles are the soft tissue that contracts to move the bones. They are made of muscle fibers. The muscles are divided into the skeletal muscles (attached to bones) and the smooth muscles (not attached to bones). The skeletal muscles are voluntary, meaning they can be controlled by the conscious mind. The smooth muscles are involuntary, meaning they cannot be controlled by the conscious mind.

THE JOINTS
The joints are the points where two bones meet. They allow the bones to move relative to each other. There are three main types of joints: ball-and-socket joints (e.g., hip, shoulder), hinge joints (e.g., elbow, knee), and pivot joints (e.g., neck).

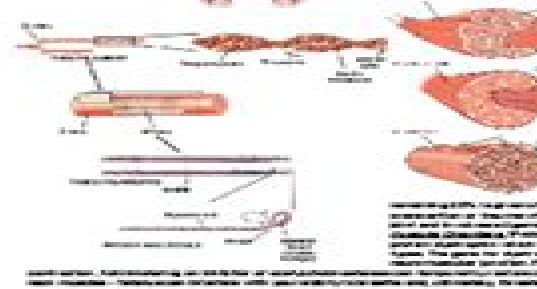

THE NERVOUS SYSTEM
The nervous system is the communication system of the body. It is composed of the brain, spinal cord, and nerves. The brain is the control center of the body. The spinal cord is the main pathway for information between the brain and the rest of the body. The nerves are the branches of the spinal cord that carry information to and from the rest of the body.

THE CIRCULATORY SYSTEM
The circulatory system is the system that transports blood throughout the body. It is composed of the heart, blood vessels, and blood. The heart is the pump that moves the blood. The blood vessels are the pipes that carry the blood. The blood is the fluid that carries oxygen and nutrients to the cells and removes waste products from the cells.

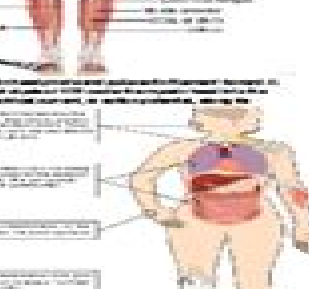

THE ENDOCRINE SYSTEM
The endocrine system is the system that produces and releases hormones. It is composed of the hypothalamus, pituitary gland, thyroid gland, parathyroid glands, adrenal glands, and pancreas. The hormones are chemical messengers that travel through the bloodstream to target organs and tissues, where they regulate various functions of the body.

THE IMMUNE SYSTEM
The immune system is the system that defends the body against disease. It is composed of the white blood cells, antibodies, and the lymphatic system. The white blood cells are the soldiers of the immune system. The antibodies are proteins that bind to and destroy foreign invaders. The lymphatic system is the network of vessels that carries the white blood cells and antibodies throughout the body.

THE REPRODUCTIVE SYSTEM
The reproductive system is the system that produces offspring. It is composed of the testes in males and the ovaries in females. The testes produce sperm, and the ovaries produce eggs. The sperm and eggs combine to form a zygote, which develops into a fetus.

THE EXCRETORY SYSTEM
The excretory system is the system that removes waste products from the body. It is composed of the kidneys, ureters, bladder, and urethra. The kidneys filter the blood and remove waste products. The ureters carry the waste products to the bladder. The bladder stores the waste products until they are removed from the body through the urethra.
