Learning Directory, 1970 **A Catalogue of the Anatomical & Zoological Museum** Joshua Brookes, 1828 [Approaching Human Performance](#) Markus

Grebenstein, 2014-01-24 Humanoid robotics have made remarkable progress since the dawn of robotics So why don t we have humanoid robot assistants in day to day life yet This book analyzes the keys to building a successful humanoid robot for field robotics where collisions become an unavoidable part of the game The author argues that the design goal should be real anthropomorphism as opposed to mere human like appearance He deduces three major characteristics to aim for when

designing a humanoid robot particularly robot hands Robustness against impacts Fast dynamics Human like grasping and manipulation performance Instead of blindly copying human anatomy this book opts for a holistic design methodology It analyzes human hands and existing robot hands to elucidate the important functionalities that are the building blocks toward these necessary characteristics They are the keys to designing an anthropomorphic robot hand as illustrated in the high performance anthropomorphic Awiwi Hand presented in this book This is not only a handbook for robot hand designers It gives a comprehensive survey and analysis of the state of the art in robot hands as well as the human anatomy It is also aimed at researchers and roboticists interested in the underlying functionalities of hands grasping and manipulation The methodology of functional abstraction is not limited to robot hands it can also help realize a new generation of humanoid robots to accommodate a broader spectrum of the needs of human society

Brain-Computer Interfaces Desney S. Tan,Anton Nijholt,2010-06-10 For generations humans have fantasized about the ability to create devices that can see into a person s mind and thoughts or to communicate and interact with machines through thought alone Such ideas have long captured the imagination of humankind in the form of ancient myths and modern science fiction stories Recent advances in cognitive neuroscience and brain imaging technologies have started to turn these myths into a reality and are providing us with the ability to interface directly with the human brain This ability is made possible through the use of sensors that monitor physical processes within the brain which correspond with certain forms of thought Brain Computer Interfaces Applying our Minds to Human Computer Interaction broadly surveys research in the Brain Computer Interface domain More specifically each chapter articulates some of the challenges and opportunities for using brain sensing in Human Computer Interaction work as well as applying Human Computer Interaction solutions to brain sensing work For researchers with little or no expertise in neuroscience or brain sensing the book provides background information to equip them to not only appreciate the state of the art but also ideally to engage in novel research For expert Brain Computer Interface researchers the book introduces ideas that can help in the quest to interpret intentional brain control and develop the ultimate input device It challenges researchers to further explore passive brain sensing to evaluate interfaces and feed into adaptive computing systems Most importantly the book will connect multiple communities allowing research to leverage their work and expertise and blaze into the future

Information-theoretic

causal inference of lexical flow Johannes Dellert, 2019 This volume seeks to infer large phylogenetic networks from phonetically encoded lexical data and contribute in this way to the historical study of language varieties The technical step that enables progress in this case is the use of causal inference algorithms Sample sets of words from language varieties are preprocessed into automatically inferred cognate sets and then modeled as information theoretic variables based on an intuitive measure of cognate overlap Causal inference is then applied to these variables in order to determine the existence and direction of influence among the varieties The directed arcs in the resulting graph structures can be interpreted as reflecting the existence and directionality of lexical flow a unified model which subsumes inheritance and borrowing as the two main ways of transmission that shape the basic lexicon of languages A flow based separation criterion and domain specific directionality detection criteria are developed to make existing causal inference algorithms more robust against imperfect cognacy data giving rise to two new algorithms The Phylogenetic Lexical Flow Inference PLFI algorithm requires lexical features of proto languages to be reconstructed in advance but yields fully general phylogenetic networks whereas the more complex Contact Lexical Flow Inference CLFI algorithm treats proto languages as hidden common causes and only returns hypotheses of historical contact situations between attested languages The algorithms are evaluated both against a large lexical database of Northern Eurasia spanning many language families and against simulated data generated by a new model of language contact that builds on the opening and closing of directional contact channels as primary evolutionary events The algorithms are found to infer the existence of contacts very reliably whereas the inference of directionality remains difficult This currently limits the new algorithms to a role as exploratory tools for quickly detecting salient patterns in large lexical datasets but it should soon be possible for the framework to be enhanced e g by confidence values for each directionality decision
