- **Organ:** A structure made up of different tissues that work together to perform a specific function.
- **System:** A group of organs that work together to perform a specific function.

CELL AND TISSUE

Cell: The basic unit of life. It is a small, self-contained unit that can perform all the functions of life.

Types of cells:
• **Prokaryotic cells:** These cells lack a nucleus and other membrane-bound organelles. They are found in bacteria and archaea.

Eukaryotic cells: These cells have a nucleus and other membrane-bound organelles. They are found in plants, animals, and fungi.

Plant cells: These cells have a cell wall, a large central vacuole, and chloroplasts.

Animal cells: These cells lack a cell wall, a large central vacuole, and chloroplasts.

NERVOUS SYSTEM

Brain: The central control center of the nervous system. It is located in the head and is protected by the skull.

Types of neurons:
• **Sensory neurons:** These neurons carry information from the receptors to the brain.

• **Motor neurons:** These neurons carry information from the brain to the effectors.

• **Interneurons:** These neurons are located in the brain and spinal cord. They connect sensory neurons to motor neurons.

Spinal cord: The spinal cord is a long, thin, tube-like structure that runs down the back. It is protected by the vertebral column.

MUSCLES

Types of muscles:
• **Skeletal muscles:** These muscles are attached to bones and are under voluntary control.

• **Smooth muscles:** These muscles are found in the walls of internal organs and are under involuntary control.

• **Cardiac muscles:** These muscles are found in the heart and are under involuntary control.

Structure of a muscle:
• **Fiber:** A long, cylindrical cell that is specialized for contraction.

• **Sarcomere:** The basic unit of contraction in a muscle fiber.

• **Myofibril:** A long, thin structure made up of sarcomeres.

• **Muscle fiber:** A long, cylindrical cell that is made up of myofibrils.

Spinal cord: The spinal cord is a long, thin, tube-like structure that runs down the back. It is protected by the vertebral column.

Peripheral nerves: These nerves are located outside the brain and spinal cord. They carry information between the brain and spinal cord and the rest of the body.

CELLS OF NERVE

Neuron: The basic unit of the nervous system. It is a specialized cell that can receive and conduct electrical impulses.

Types of neurons:
• **Sensory neurons:** These neurons carry information from the receptors to the brain.

• **Motor neurons:** These neurons carry information from the brain to the effectors.

• **Interneurons:** These neurons are located in the brain and spinal cord. They connect sensory neurons to motor neurons.

Structure of a neuron:
• **Dendrites:** These are short, branching structures that receive information from other neurons.

• **Cell body:** The cell body contains the nucleus and other organelles.

• **Axon:** The axon is a long, thin structure that carries information away from the cell body.

• **Axon hillock:** The axon hillock is the point where the axon meets the cell body. It is the site where an action potential is initiated.

• **Myelin sheath:** The myelin sheath is a layer of fatty tissue that surrounds the axon. It insulates the axon and speeds up the conduction of electrical impulses.

• **Nerve fiber:** A nerve fiber is a long, thin structure that is made up of an axon and its myelin sheath.
