Islam,2018-07-31 The only book that covers fundamental shipboard design and verification concepts from individual devices to the system level Shipboard electrical system design and development requirements are fundamentally different from utility based power generation and distribution requirements Electrical engineers who are engaged in shipbuilding must understand various design elements to build both safe and energy efficient power distribution systems This book covers all the relevant technologies and regulations for building shipboard power systems which include commercial ships naval ships offshore floating platforms and offshore support vessels In recent years offshore floating platforms have been frequently discussed in exploring deep water resources such as oil gas and wind energy This book presents step by step shipboard electrical system design and verification fundamentals and provides information on individual electrical devices and practical design examples along with ample illustrations to back them In addition Shipboard Power Systems Design and Verification Fundamentals Presents real world examples and supporting drawings for shipboard electrical system design Includes comprehensive coverage of domestic and international rules and regulations e g IEEE 45 IEEE 1580 Covers advanced devices such as VFD Variable Frequency Drive in detail This book is an important read for all electrical system engineers working for shipbuilders and shipbuilding subcontractors as well as for power engineers in general

The Electronic Design Automation Handbook Dirk Jansen,2010-02-23 When I attended college we studied vacuum tubes in our junior year At that time an average radio had ve vacuum tubes and better ones even seven Then transistors appeared in 1960s A good radio was judged to be one with more thententransistors Latergoodradioshad15 20transistors and after that everyone stopped counting transistors Today modern processors runing personal computers have over 10milliontransistorsandmoremillionswillbeaddedevery year The difference between 20 and 20M is in complexity methodology and business models Designs with 20 tr sistors are easily generated by design engineers without any tools whilst designs with 20M transistors can not be done by humans in reasonable time without the help of Prof Dr Gajski demonstrates the Y chart automation This difference in complexity introduced a paradigm shift which required sophisticated methods and tools and introduced design automation into design practice By the decomposition of the design process into many tasks and abstraction levels the methodology of designing chips or systems has also evolved Similarly the business

model has changed from vertical integration in which one company did all the tasks from product specification to manufacturing to globally distributed client server production in which most of the design and manufacturing tasks are outsourced
