

LAB ACTIVITY 1 Classification of Bones According to Shape

- 1 Classify each of the bones your instructor has displayed according to shape.
- 2 Discuss with the rest of the class which bones are difficult to classify and why.

B. Gross Features of Long Bones

The enlarged proximal and distal ends of long bones are called **epiphyses** (*epi-* = above, over; *-physis* = growing), and the middle shaft area is called the **diaphysis** (*dia-* = through). Compact bone forms the exterior (or cortex) of long bones and most of the diaphysis. A small layer of spongy bone lines the interior of the diaphysis. Spongy bone also forms the interior of the epiphyses. The **metaphyses** are the areas in an adult bone where the epiphyses and diaphysis join. In a growing bone, the metaphyses contain a layer of hyaline cartilage called the **epiphyseal plate**. Division of cartilage allows the bone to grow in length. Bone growth stops when the epiphyseal plate cartilage becomes ossified and forms a bony structure called the **epiphyseal line**.

Articular cartilage (*articular-* = joints), composed of hyaline cartilage, covers both epiphyses, and the rest of the bone exterior is covered with a tough, connective tissue membrane, the **periosteum** (*peri-* = around; *-osteum* = bony part).

The hollow center of the bony diaphysis is called the **medullary cavity** (*medula-* = marrow, pulp), and a small amount of spongy bone is found in this cavity. The medullary cavity is lined with a connective tissue membrane called the **endosteum** (*endo-* = within). The endosteum also lines the cavities within the spongy bone of the epiphyses. Both the periosteum and the endosteum contain **osteoblasts** (*-blast* = builder) and **osteoclasts** (*-clast* = breaker) for bone formation, bone tissue repair, and bone remodeling.

Yellow marrow is a fatty substance found within the medullary cavity. **Red marrow** is found within the cavities of spongy bone and produces blood cells.

The **nutrient artery** is a large artery that enters compact bone near the middle of the diaphysis. The nutrient artery immediately branches into proximal and distal portions, which supply blood to the inner layer of compact bone, spongy bone, and red marrow. The **nutrient foramen** is the foramen through which the nutrient artery enters.
