

Mitosis Worksheet

The diagram below shows six cells in various phases of the cell cycle. Note the cells are not arranged in the order in which mitosis occurs and one of the phases of mitosis occurs twice. Use the diagram to answer questions 1-7.

- 1) Cells A and F show an early and a late stage of the same phase of mitosis. What phase is it?
A - early prophase, F - late prophase
- 2) Which cell is in metaphase?
C
- 3) Which cell is in the first phase of mitosis?
A (if consider prophase 1st) but D (if consider interphase 1st)
- 4) In cell A, what structure is labeled X?
Centrioles
- 5) Which cell is in the "in between" phase of mitosis?
D (interphase, where the cell is being the cell it was created to be!)
- 6) Place the diagrams in order from first to last.
A, F, C, E, B, D (some may put D first. Remember this is a cycle so how the order is viewed is subjective)
- 7) Are the cells depicted plant or animal cells? Explain your answer.
Animal - round in shape
- 8) What is the longest phase of the cell cycle?
D
- 9) Why is mitosis important?
Allows cells to reproduce, making exact copies of themselves

not surprising that mutations in genes encoding various DDR proteins cause embryonic lethality malignancies neurodegenerative diseases and premature ageing The importance of DDR for cell survival and genome stability is unquestionable but how the sophisticated network of hundreds of different DDR proteins is spatiotemporally coordinated is far from being understood In the last ten years ubiquitin ubiquitination and the ubiquitin relative SUMO sumoylation have emerged as essential posttranslational modifications that regulate DDR Beside a plethora of ubiquitin and sumo E1 activating enzymes E2 conjugating enzymes E3 ligases and ubiquitin sumo proteases involved in ubiquitination and sumoylation the complexity of ubiquitin and sumo systems is additionally increased by the fact that both ubiquitin and sumo can form a variety of different chains on substrates which govern the substrate fate such as its interaction with other proteins changing its enzymatic activity or promoting substrate degradation The importance of ubiquitin SUMO systems in the orchestration of DDR is best illustrated in patients with mutations in E3 ubiquitin ligases BRCA1 or RNF168 BRCA1 is essential for proper function of DDR and its mutations lead to triple negative breast and ovarian cancers RNF168 is an E3 ubiquitin ligase which creates the ubiquitin docking platform for recruitment of different DNA damage signalling and repair proteins at sites of DNA lesion and its mutations cause RIDDLE syndrome characterized by radiosensitivity immunodeficiency and learning disability In addition recently discovered the ubiquitin receptor protein SPRTN is part of the DNA replication machinery and its mutations cause early onset hepatocellular carcinoma and premature ageing in humans Despite more than 700 different enzymes directly involved in ubiquitination and sumoylation processes only few of them are known to play a role in DDR Therefore we feel that the role of ubiquitin and the ubiquitin related SUMO in DDR is far from being understood and that this is the emerging field that will hugely expand in the next decade due to the rapid development of a new generation of technologies which will allow us a more robust and precise analyses of human genome transcriptome and proteome In this Research Topic we provide a comprehensive overview of our current understanding of ubiquitin and SUMO pathways in all aspects of DDR from DNA replication to different DNA repair pathways and demonstrate how alterations in these pathways cause genomic instability that is linked to degenerative diseases cancer and pathological ageing

INTRODUCTION FOR HEART 3D BIOPRINTING - BOOK 2 Edenilson Brandl,2024-05-18 The realm of bioprinting especially 3D bioprinting of complex organs such as the heart is at the forefront of modern medical science This book Introduction to Heart 3D Bioprinting Introduction to Cell Biology and The 3D Bioprinting serves as a comprehensive guide to understanding the intricate relationship between cell biology and the innovative field of 3D bioprinting In the rapidly advancing field of bioprinting the ability to create functional heart tissues and eventually whole organs holds immense promise for addressing the global shortage of donor organs and improving outcomes for patients with severe cardiovascular diseases However this ambition requires a profound understanding of cell biology tissue engineering and the bioprinting technologies that can bring these visions to reality This book is divided into two primary sections The first section delves into the fundamentals of cell

biology providing detailed insights into cellular mechanisms structures and processes that are crucial for anyone looking to explore or work in the field of bioprinting Topics such as cytoskeleton regulation cellular respiration DNA replication and stem cell biology are meticulously covered to lay a robust foundation for understanding how cells can be manipulated and utilized in bioprinting applications It explores the techniques materials and technologies used to create three dimensional biological structures This section discusses the integration of cells into bioprinted constructs the challenges of mimicking the complex architecture of the heart and the innovative solutions being developed to overcome these hurdles Together these sections provide a detailed roadmap from the basic principles of cell biology to the cutting edge applications of 3D bioprinting Whether you are a student researcher or practitioner this book aims to equip you with the knowledge and tools necessary to contribute to the exciting advancements in heart 3D bioprinting I would like to express my gratitude to the countless researchers and pioneers in the fields of cell biology and bioprinting whose work has made this book possible Their dedication to advancing science and medicine inspires us to push the boundaries of what is possible and strive for innovations that can transform lives
