Crabtree,2013-02-19 Energy production and storage are central problems for our time In principle abundant energy is available from the sun to run the earth in a sustainable way Solar energy can be directly harnessed by agricultural and photovoltaic means but the sheer scale of the energy demand poses severe challenges for example any major competition between biomass production and food production would simply transfer scarcity from energy to food Indirect use of solar energy in the form of wind looks also promising especially for those regions not blessed with abundant sunlight Other modes such as tidal and wave energy may well become important niche players Inorganic chemistry plays a decisive role in the development of new energy technologies and this Volume covers some promising modes of alternative energy production and storage that minimize the atmospheric burden of fossil derived carbon monoxide No one production or storage mode is likely to dominate at least at first and numerous possibilities need to be explored to compare their technical feasibility and economics This provides the context for a broad exploration of novel ideas that we are likely to see in future years as the field expands This Volume covers a wide range of topics such as Water splitting only water is a
