Schmeltz,2012-12-06 The present volume comprises a compilation of papers presented as a Symposium on the Chemical Composition of Tobacco and Tobacco Smoke during a meeting of the American Chemical Society in Washington D C September 12 17 1971 The Symposium was organized so as to cover in the time allotted those aspects of tobacco research that are both pertinent and relevant to the most demanding problem facing researchers in the field today that is the development of a less hazardous cigarette The path to such an objective however is still rather long and not easily traversed For example in identifying the hazard associated with smoking one must first know something of the chemical composition of tobacco smoke and moreover how the smoke components arise from the various leaf components In addition bioassays of smoke fractions and components therein are necessary to identify noxious substances and to correlate biological activity with chemical composition Finally to achieve the stated objective methods need to be developed for removing the identified hazards from the smoke whether they be by specially cultivating tobacco plants or by modifying tobacco smoke through the use of filters additives or similar devices *Resources in Education* ,1996 ENC Focus ,2001 Scientific Information Bulletin ,1988

Marie-Luise Sautter-Bihl, Heiner Bihl, Michael Wannenmacher, 2012-12-06 Almost a century ago Paul Ehrlich introduced the magic bullet concept of targeting therapeutic agents to specific tissues in order to reduce systemic toxicity Due to the advances in hybridoma technology in the 1980s monoclonal antibodies (MAbs) with their exquisite affinity to tumor antigens have become powerful tools in the treatment of cancer especially when linked to therapeutic agents such as radionuclides drugs toxins or enzymes It can now be expected that such agents will lead to new cancer treatments with high therapeutic success rates However there are major problems in developing this therapeutic concept to a routine treatment modality This is partly due to factors such as heterogeneous distribution of tumor antigens insufficient blood supply of tumors high interstitial pressure and the large interstitial space that antibodies have to traverse This book is focused on the development in radio immunotherapy (RIT) using radio labeled monoclonal antibodies as tumor toxic agents This area of research has attracted the interest of clinicians and scientists from many different disciplines It is now clear that the full potential of RIT can only be realized through the concerted efforts of laboratory scientists molecular biologists cell physiologists chemists radiation physicists and biologists and cancer clinicians in nuclear medicine radio oncology and internal oncology
