

Biology Exam 1 Study Guide

Lecture 1 → Introduction to Biological Science

Tree of Life

- Domains
 - Eukarya → visible life
 - Split into animals and plants
 - Very small portion
 - Bacteria → single cell
 - Make up most of life's branches
 - Symbionts that evolved into mitochondria and chloroplasts were eubacteria
 - Archaea → original domain of life
 - More closely related to eukaryotes than eubacteria, first branch of life
 - Basic split between archaea and bacteria
- Candidate phyla radiation: Single species have been identified, each identifies an entire phylum which is yet to be understood - pioneer species (tree is dominated by new species that scientists have never seen before)
- Species disappearing faster than can be recovered
- Eukaryotes and archaea are most closely related branches

Destruction and Mass Extinction

- One million species face imminent extinction because of humans
- Recent past → >50% vertebrates/>75% flying insects lost in the past <50 years
- Critically threatened → >40% amphibians, >30% plants/corals/sharks, >25% mammals
- Populations and extinctions have increased

Theory of Evolution

- Evolution: all life on earth evolved from a common ancestor, most properties within cells work in the same way, the change in gene distribution over time within a population
- Theory: a very well substantiated idea that explains many overlapping phenomena at once, wide-ranging, strongest. Not a hypothesis
- Darwin: species arise through random mutation and natural selection for fitness
- Evidence (fewer than 40% of Americans believe in evolution)
 - fossil record shows conservation of homologous structures
 - Molecular proof: same DNA and RNA protein in cells
 - Homologous function in hands and fins → evolved similar mechanisms in appendages
- Scopes Monkey Trial
 - Scopes taught evolution illegally; resulted in Butler Act → forbid teaching evolution in TN
- Endosymbiont theory
 - Single composite cell of greater complexity could evolve from two or more separate simpler living cells in a symbiotic relationship

Year of Earth's History

- 1 Jan: earth formed 4.54 bya by acceleration of material from the solar nebula via gravitational collapse, conditions were incompatible with life, bombarded with asteroid-sized meteors for 800 million years
- 4 Mar: by 3.8 bya bombardment had slowed, Earth had cooled to lower the temps "compatible" with life

Mosquitoes of the World, Richard C. Wilkerson, Yvonne-Marie Linton, Daniel Strickman, 2021-01-19. The definitive reference on the biology, evolution, ecology and diversity of all known species of the world's mosquitoes. Critical for entomologists, public health professionals and epidemiologists across the world. Biting multiple times on two, three or more different hosts, it is no surprise that some species of mosquitoes have co-evolved with pathogens. For humans and other animals, the result has been some of the most challenging diseases known. It has been said that *Anopheles gambiae*, as the primary transmitter of malaria parasites to humans, is the most dangerous animal in the world. Certainly, malaria has killed more people than all the wars that ever took place. Even now, despite drugs and mosquito control, malaria claims the lives of 405,000 per year. The vast majority of mosquito species are not involved in pathogen transmission to humans, but those that are, make a huge impact on global health. In this two volume set, three of the world's leading experts on mosquito disease, ecology and systematics offer readers unique insights into the fascinating world of mosquitoes while illustrating their diagnostic morphological features in detail. Comprehensively addressing the natural diversity of mosquitoes, the book explains their life histories, biotic traits and the physiological and physical adaptations they evolved in response to ever changing environmental conditions. Mosquitoes are one of the best known groups of insects, making this book a great starting place for anyone who would like to understand

entomology by knowing the details about a representative family Volume One contains a review of the biology and diversity of mosquitoes Biology is treated in the following chapters Evolution Nomenclature Distribution Dormancy Mosquito Movement Feeding and Nutrition Excretion Copulation and Insemination Egg Development and Oviposition The chapters on biology are followed by a well illustrated summary of the characteristics of all 41 genera and of representative species of mosquitoes This treatment of the morphological diversity of mosquitoes is accompanied by a glossary of all morphological terms used Volume Two features a long awaited comprehensive mosquito taxonomic catalog detailing the current taxonomic and systematic status of all 3 698 valid species and subspecies 41 genera and 187 subgenera a list of all taxa for definitive use of nomenclature complete lists of species synonyms distributions key taxonomic works and newly defined informal names origins of scientific names Readers will discover that some mosquitoes undertake courtship rituals while others guard their eggs feed solely on earthworms or can survive as immatures under ice sheets or in salt encrusted pools Hundreds of drawings and high resolution close up images illustrate the text The most complete reference work on mosquitoes ever produced Mosquitoes of the World is an unmatched resource for entomologists public health professionals epidemiologists and reference libraries

Effects of Drought on Forests and Rangelands in the United States James M. Vose, James Samuel Clark, Charles Henry Luce, Toral Patel-Weynand, 2016 This assessment provides input to the reauthorized National Integrated Drought Information System NIDIS and the National Climate Assessment NCA and it establishes the scientific foundation needed to manage for drought resilience and adaptation Focal areas include drought characterization drought impacts on forest processes and disturbances such as insect outbreaks and wildfire and consequences for forest and rangeland values Drought can be a severe natural disaster with substantial social and economic consequences Drought becomes most obvious when large scale changes are observed however even moderate drought can have long lasting impacts on the structure and function of forests and rangelands without these obvious large scale changes Large stand level impacts of drought are already underway in the West but all U S forests are vulnerable to drought Drought associated forest disturbances are expected to increase with climatic change Management actions can either mitigate or exacerbate the effects of drought A first principal for increasing resilience and adaptation is to avoid management actions that exacerbate the effects of current or future drought Options to mitigate drought include altering structural or functional components of vegetation minimizing drought mediated disturbance such as wildfire or insect outbreaks and managing for reliable flow of water
