Gross Anatomy and Basic Function of the Endocrine Glands

- Both the endocrine and nervous systems are major regulating systems of the body; however, the nervous system has been compared to a text message, and the endocrine system to mailing a letter. Briefly explain this comparison.

Nervous system controls homeostasis through nerve impulses, it generates
transmit electrical impulses less than a second in order for muscle, tissue, gland
to contract. Endocrine system takes time to release hormones into bloodstream and reaches
the destination.

- Define hormone. Hormones are chemical substances that regulate
the internal environment, metabolism, energy balance & production.
- Chemically, hormones belong chiefly to two molecular groups, the water-soluble hormones
and the steroid & lipid soluble hormones.
- Define target cell. A cell that has receptors to recognize/respond
to a given hormone
- If hormones travel in the bloodstream, why don't all tissues respond to all hormones? because hormones can
only bind with specific receptors of the target cell
- Identify the endocrine organ described by each of the following statements.

- | | |
|----------------------|---|
| <u>Thyroid gland</u> | 1. located in the anterior neck; produces key hormones for metabolism |
| <u>Hypothalamus</u> | 2. produces the hormones that are stored in the posterior pituitary |
| <u>Pancreas</u> | 3. a mixed gland, located behind the stomach and close to the small intestine |
| <u>Testes</u> | 4. paired glands suspended in the scrotum |
| <u>Pituitary</u> | 5. bilobed gland located in the sella turcica |
| <u>Ovaries</u> | 6. found in the pelvic cavity of the female, concerned with ova and female hormone production |
| <u>Thyroid</u> | 7. found in the upper thorax overlying the heart; large during youth |
| <u>Pineal</u> | 8. found in the roof of the third ventricle of the brain |
