Linear Functions and Matrix Theory Bill Jacob, 2012-12-06 Courses that study vectors and elementary matrix theory and introduce linear transformations have proliferated greatly in recent years Most of these courses are taught at the undergraduate level as part of or adjacent to the second year calculus sequence Although many students will ultimately find the material in these courses more valuable than calculus they often experience a class that consists mostly of learning to implement a series of computational algorithms The objective of this text is to bring a different vision to this course including many of the key elements called for in current mathematics teaching reform efforts Three of the main components of this current effort are the following

- 1 Mathematical ideas should be introduced in meaningful contexts with after a clear

understanding formal definitions and procedures developed of practical situations has been achieved 2 Every topic should be treated from different perspectives including the numerical geometric and symbolic viewpoints 3 The important ideas need to be visited repeatedly throughout the term with students understanding deepening each time This text was written with these three objectives in mind The first two chapters deal with situations requiring linear functions at times locally linear functions or linear ideas in geometry for their understanding These situations provide the context in which the formal mathematics is developed and they are returned to with increasing sophistication throughout the text

Linear Algebra H. E. Rose, 2002
Linear algebra is one of the most important branches of mathematics important because of its many applications to other areas of mathematics and important because it contains a wealth of ideas and results which are basic to pure mathematics This book gives an introduction to linear algebra and develops and proves its fundamental properties and theorems taking a pure mathematical approach linear algebra contains some fine pure mathematics Main topics vector spaces and algebras dimension linear maps direct sums and briefly exact sequences matrices and their connections with linear maps determinants properties proved using some elementary group theory and linear equations Cayley Hamilton and Jordan theorems leading to the spectrum of a linear map this provides a geometric type description of these maps Hermitian and inner product spaces introducing some metric properties distance perpendicularity etc into the theory also unitary and orthogonal maps and matrices applications to finite fields mathematical coding theory finite matrix groups the geometry of quadratic forms quaternions and Cayley numbers and some basic group representation theory A large number of examples exercises and problems are provided Answers and or sketch solutions to all of the problems are given in an appendix Some of these are theoretical and some numerical both types are important No particular computer algebra package is discussed but a number of the exercises are intended to be solved using one of these packages chosen by the reader The approach is pure mathematical and the intended readership is undergraduate mathematicians also anyone who requires a more than basic understanding of the subject This book will be most useful for a second course in linear algebra that is for students that have seen some elementary matrix algebra But as all terms are defined from scratch the book can be used for a first course for more advanced students

Beckenbach,R. Bellman,2012-12-06 Since the elassie work on inequalities by HARDY LITTLEWOOD and P6LYA in 1934 an enonnous amount of effort has been devoted to the sharpening and extension of the elassieal inequalities to the discovery of new types of inequalities and to the application of inqualities in many parts of analysis As examples let us eite the fields of ordinary and partial differential equations whieh are dominated by inequalities

and variational principles involving functions and their derivatives the many applications of linear inequalities to game theory and mathematical economics which have triggered a renewed interest in convexity and moment space theory and the growing uses of digital computers which have given impetus to a systematic study of error estimates involving much sophisticated matrix theory and operator theory The results presented in the following pages reflect to some extent these ramifications of inequalities into contiguous regions of analysis but to a greater extent our concern is with inequalities in their native habitat Since it is clearly impossible to give a connected account of the burst of analytic activity of the last twenty five years centering about inequalities we have decided to limit our attention to those topics that have particularly delighted and intrigued us and to the study of which we have contributed
